

Features and Benefits

- Active current sharing between LED strings for ±1.5% typical current matching and ±1.2% typical accuracy
- Drive up to 12 series \times 8 parallel = 96 LEDs ($V_f = 3.2 \text{ V}, I_f = 20 \text{ mA}$)
- Flexible dimming, using alternative methods:
 - LED duty cycle control (PWM pin)
 - DC current using serial programming (EN pin)
 - DC current using external PWM signal (APWM pin)
 - An external resistor
- Boost converter with integrated 50 V, 2 A DMOS
- LED sinks rated for 25 mA
- 200 kHz to 2 MHz switching frequency
- Open LED disconnect
- Boost current limit, thermal shutdown, and soft start
- No audible ceramic capacitor noise during PWM dimming
- Adjustable overvoltage protection (OVP)
- No pull-up resistors required for LED modules that use ESD capacitors

Package: 26 pin QFN/MLP (suffix EC)

Description

The A8500 is a multi-output WLED driver for medium display backlighting. The A8500 integrates a boost converter and eight current-sinks to provide a flexible WLED/RGB backlight driver. The boost converter can provide output voltage up to 47 V. The flexible channel selection control and high voltage capability allow a wide range of LED backlight applications. The A8500 can support any application requiring 4 to 96 WLEDs. The boost converter is a constant frequency current-mode converter.

Each LED channel can sink 25 mA, and channels can be paralleled for higher currents. Flexible dimming allows output channels to either run at an adjustable DC value or with externally controlled PWM duty cycles.

The A8500 is available in a 26 pin, 4 mm \times 4 mm QFN/MLP package that is only 0.75 mm nominal in height. Applications include:

- Thin notebook displays
- LCD TV
- RGB backlight
- GPS systems
- Portable DVD players

Typical Application

Figure 1. LCD monitor backlight, driving 96 LEDs. LED V_f = 3.2 V, 20 mA per LED string. Overvoltage protection set to 45 V nominal (40.5 V minimum). Alternative dimming control pulse trains illustrated for EN, PWM, and APWM control. See also: Recommended Components table, page 14.

Performance Characteristics

Efficiency with EN dimming is similar to that with APWM dimming. APWM light load efficiency can be improved by reducing boost switching frequency with SKIP set high.

PWM Efficiency V_{IN} = 5 V, 6 ch. with 7 LEDs per ch., 20 mA per ch., f_{SW} = 1 MHz

PWM Efficiency V_{IN} = 5 V, 6 ch. with 7 LEDs per ch., 20 mA per ch., f_{SW} = 2 MHz

APWM Efficiency V_{IN} = 5 V, 6 ch. with 7 LEDs per ch., 20 mA per ch., f_{SW} = 1 MHz

APWM Efficiency V_{IN} = 5 V, 6 ch. with 7 LEDs per ch., 20 mA per ch., f_{SW} = 2 MHz

Efficiency versus Input Voltage with EN Dimming $V_{IN} = V_{BAT}$, 8 ch. with 8 LEDs per ch., $f_{SW} = 1$ MHz

Performance Characteristics

1 A 200 µs

Functional Description

The A8500 is a multioutput WLED driver for medium display backlighting. The A8500 works with 4.2 to 5.5 V input supply, and it has an integrated boost converter to boost a 5 V battery voltage up to 47 V, to drive up to 12 WLEDs in 6 series (V_f = 3.2 V, $I_f = 20$ mA), or 8 WLEDs in 8 series at 20 mA per LED string. For higher LED power or more LEDs, an inductor can be connected to a separate power supply, V_{BAT}, from 5 to 25 V, with the A8500 IC powered from a 5 V source. The LED sinks can sink up to a 25 mA current.

The boost converter is a constant frequency current-mode converter. The integrated boost DMOS switch is rated for 50 V at 2 A. This switch has pulse-by-pulse current limiting, with the current limit independent of duty cycle. The switch also has output overvoltage protection (OVP), with the OVP level adjustable, typically from 30 to 47 V, as described in the Device Internal Protection section.

The A8500 has individual open LED detection. If any LED opens, the corresponding LED pin is removed from regulation logic. This allows the remaining LED strings to function normally, without excessive power dissipation.

The switching frequency, f_{SW} , can be set from 600 kHz to 2 MHz by a single resistor, RFSET, connected across the FSET and AGND pins, and with the SKIP pin set to logic low (see figure 2).

The switching frequency is set as:

$$F_{SW} = 26.03 / R_{FSET}$$
,

where F_{SW} is in MHz and R_{FSET} is in $k\Omega$ When the SKIP pin is connected to logic low, switching frequency is as set by RFSET. When the SKIP pin is connected to logic high, the switching frequency is divided by 4. The SKIP pin can be used to reduce switching frequency in order to reduce switching losses and improve efficiency at light loads.

The IC offers a wide-bandwidth transconductance amplifier with external COMP pin. External compensation offers optimum performance for the desired application.

The A8500 has eight well-matched current sinks to provide regulated current through LEDs for uniform display brightness. The quantity of LEDx pins used is determined by the SELx pins. Refer to table 1 for further description.

The boost converter is controlled such that the minimum voltage on any LEDx pin is 500 mV. In a typical application, the LEDx pin connected to the LED string with the maximum voltage drop controls the boost loop, so the remaining pins will also have the higher voltage drop. All LED sinks are rated for 21 V, to allow PWM dimming control.

LED Current Setting

The maximum LED current can be set at up to 25 mA per channel, by using the ISET pin. To set the reference current, I_{SET}, connect a resistor, RISET, between this pin and ground, valued according to the following formula:

$$I_{\text{SET}} = 1.23 / R_{\text{ISET}}$$
,

where I_{SET} is in mA and R_{ISET} is in k Ω .

Figure 2. Switching frequency setting by value of RFSET.

Allegro MicroSystems, Inc. 8

This current is multiplied internally with a gain of 210, and then mirrored on all enabled LEDx pins. This sets the maximum current through the LEDs, referred to as "100% current." The effects of the value of $R_{\rm ISET}$ are shown in figure 3.

The LED current can be reduced from 100% by any of three alternative methods. These modes are:

- serial dimming through the EN pin,
- on/off control (PWM) with an external PWM signal on the PWM pin, and
- analog dimming with an external PWM signal on the APWM pin.

Note: Only one dimming technique can be used at a time.

Serial Dimming Through the EN Pin. When the EN pin is pulled high with PWM, and the APWM pin is low, the A8500 starts up in serial programming mode. In this mode, series of pulses applied to the EN pin are used to adjust the output current level, I_{LEDx} to a proportion of the ISET current, in equal increments, as listed in table 2.

As shown in the timing diagram in figure 4, serial dimming is disabled during startup, for the $t_{HI(init)}$ period. After that, the

Table 2. Serial Dimming Levels

Pulse Count	I _{LEDx}	Pulse Count	I _{LEDx}
0	100%	8	100%×8/16
1	100%×15/16	9	100%×7/16
2	100%×14/16	10	100%×6/16
3	100%×13/16	11	100%×5/16
4	100%×12/16	12	100%×4/16
5	100%×11/16	13	100%×3/16
6	100%×10/16	14	100%×2/16
7	100%× 9/16	15	100%×1/16
		16*	100%

^{*}The counter resets on the sixteenth pulse.

A8500 begins evaluating pulse patterns applied on the EN pin. Until a valid series is evaluated, the count remains 0 and the default I_{LEDx} level remains at "100% current." A count in the range 1 to 15 is evaluated proportionately; for example, when a series of 12 pulses is evaluated, I_{LEDx} is set to 25% (100% \times 4/16) of 100% current. At a 16th pulse, the counter resets to 0 and continues to count if additional pulses are applied.

Figure 3. Effect of value of RISET on (A) "100% current" level, and (B) LEDx gain.

Figure 4. Timing diagram for serial dimming.

To indicate the end of a programming sequence, set the EN pin high for a period, t_{HID}, which is either (a) greater than 256 oscillator periods when the SKIP pin is high, or (b) greater than 64 oscillator periods when SKIP is low. When the A8500 evaluates the end of a programming sequence, it changes the current level to match the existing count (per table 2). The counter is then reset to 0 and begins counting pulses again at the next valid pulse.

If the EN pin, along with the PWM and APWM pins, is pulled low for period greater than t_{SHDN}, the A8500 shuts down. When the IC enters shutdown, LED1 through LED8 and the boost switch turn off after the t_{SHDN} period. During t_{SHDN}, the converter continues to work in normal fashion.

When enabled through the EN pin, internal references ramp up during the t_{HI(init)} period. The boost converter starts with soft start to limit input inrush current. During soft start, the boost stage is peak current limited to 1 A. All enabled LEDx sinks are set to $^{1}/_{16}$ of the set 100% current level, as V_{OUT} and the voltage on the LEDx pins increases. When all LEDx pins reach the regulation level of 0.5 V, the IC comes out of soft start, resuming normal operation with 2 A current limit on boost and 100% current through LEDx pins. A typical step response in steady state is shown in figure 5.

On/off Control (PWM) with an External PWM Signal on the **PWM Pin.** When the PWM pin is pulled high with the EN and APWM pins low, the A8500 turns on and all enabled LEDx pins sink 100% current. When the PWM pin is pulled low, the IC

Figure 5. Serial dimming response. The numbers indicate the quantity of EN pulses at each step.

shuts down with the LEDx pins disabled. External PWM applied to the PWM pin should be in the range of 100 to 400 Hz for optimal accuracy.

Figure 7. PWM pin dimming f_{PWM} = 200 Hz, Duty Cycle =10%.

Figure 8. PWM pin dimming linearity.

Figure 6. Timing diagram for dimming using the PWM pin.

At startup, the output capacitor is discharged and the IC enters soft start. The boost current is limited to 1 A, and all active LEDx pins sink $^{1}/_{16}$ of the set 100% current until all of the enabled LEDx pins reach 0.5 V. After the IC comes out of soft start, the boost current and the LEDx pin currents are set to 100% current. The output capacitor charges to the voltage level required to supply full LEDx current within a few cycles. The IC is shut down immediately when PWM goes low.

Analog Dimming with an External PWM Signal on the APWM Pin. When the APWM pin is pulled high, with the EN and PWM pins low, the A8500 turns on in this mode. The first pulse after shutdown should be greater than $t_{HI(init)}$. The logic level PWM signal applied to the APWM pin multiplies I_{SET} by the duty cycle to set the reference current level for the LED pins. The typical range for the APWM signal frequency is 20 kHz to 2 MHz. The output current ripple at 20 kHz, 50% duty cycle, is less than 5% of the set value. The LED current accuaracy at 2 MHz, 50% duty

cycle, is less than 3%. In this mode, the A8500 goes through a soft start routine similar to serial dimming.

Device Internal Protection

Overcurrent Protection (OCP). The A8500 has a pulse-by-pulse current limit of 2 A on the boost switch. This current limit is independent of duty cycle.

Thermal Shutdown Protection (TSD). The IC shuts down when junction temperature exceeds 165°C and restarts when the junction temperature falls by 40°C.

Overvoltage Protection (OVP). The A8500 has overvoltage protection to protect the IC against output overvoltage. The overvoltage level can be set, from 30 to 45 V typical, with an external resistor, ROVP, as shown in figure 10. When the current though the OVP pin exceeds $54.9 \, \mu A$, the OVP comparator goes high. When the OVP pin current falls below $47.8 \, \mu A$, OVP is reset.

Figure 9. APWM pin dimming linearity.

Figure 10. Overvoltage protection circuit. Three alternative configurations at (A) are available, as follows:

OVP Rating
up to 45 V
up to 47 V
redundancy

Calculate the value for R_{OVP} as follows:

$$R_{\text{OVP}} = (V_{\text{OVP}} - 30) / 54.9 \, \mu\text{A}$$
,

where V_{OVP} is the desired typical OVP level in V, and R_{OVP} is in Ω . For tighter OVP limits, a low–leakage-current Zener diode, DZ, can be used, instead of ROVP, to set OVP at up to 47 V. For redundancy, DZ can be connected across ROVP to provide additional protection, if ROVP should open. Select a 17 V low-leakage Zener diode for DZ.

Open LED Protection. The A8500 has protection against open LEDs. If any enabled LED string opens, voltage on the corresponding LEDx pin goes to zero. The boost loop operates in open loop till the OVP level is reached. The A8500 identifies the open

LED string when overvoltage on the OVP pin is detected. This string is then removed from the boost controlling loop. The boost circuit is then controlled in the normal manner, and the output voltage is regulated, to provide the output required to drive the remaining strings. If the open LED string is reconnected, it will sink current up to the programmed current level.

Note: Open strings are removed from boost regulation, but not disabled. This keeps the string in operation if LEDs open for only a short length of time, or reach OVP level on a transient event.

The disconnected string can be restored to normal mode by reenabling the IC. It can also restored to normal operation if the fault signal is removed from the corresponding LEDx pin, but an OVP event occurs on any other LEDx pin.

Figure 11. Open LED fault protection.

Application Information

A typical application circuit for dimming an LCD monitor backlight with 96 LEDs is shown in figure 1. Figure 12 shows two dimming methods: digital PWM control (PWM signal on the PWM pin) and analog PWM control, with the analog signal, V_A, applied to the ISET pin through a resistor, RA.

The current flowing through RA can be calculated as:

$$I_{\rm A} = V_{\rm A}/R_{\rm A}$$
.

This current changes the reference current, I_{SET} , as follows:

$$I_{\text{SET}} = V_{\text{SET}} / R_{\text{SET}} - (V_{\text{A}} - V_{\text{SET}}) / R_{\text{A}}$$
.

LED current can be changed by changing V_A. I_{SET} can be changed in the range from 40 μA to 120 μA .

Application Circuit for 1000:1 Dimming Level

A wider dimming range can be achieved by changing the reference current, I_{SET}, while using PWM dimming. For higher output, current levels turn on Q1. R_{ISET} and R_{ISETP} set the 100% current level. This current level can be set to 25 mA, and then it can be dimmed by applying 100% to 0.32% duty cycle on the PWM pin. The reference current can be reduced by turning off Q1. LED current can be dimmed to 8 mA by reducing reference current through ISET pin. This provides 1000:1 combined dimming level range. Figure 14 shows the accuracy, Err_{LEDX}, results using this circuit.

Figure 13. Configuration for 1000:1 dimming.

APWM On/off and analog LED current control with external PWM. Apply logic level PWM (1.2 V < V _{IH} < 5 V) for PWM controlled dimming mode. When unused, connect to AGND. 1 LED3 9 LED5 10 LED7 11 LGND 11 LGD7 11 LGND 12 LED8 13 LED6 14 LED4 15 LED2 16 SEL1 17 SEL2 18 SEL3 19 EN On/off and serial dimming control. EN high enables IC and EN low disables IC. This pin can also be used to program LEDx current. When unused, connect to AGND. 20 PWM On/off and on/off LED current control with external PWM. Apply logic level PWM for PWM controlled dimming mode. When unused, connect to AGND. 21 PGND Power ground pin. 22 OVP Connect to this pin to output capacitor +Ve node through a resistor to enable OVP (overvoltage protection). Default OVF level with 0 Ω resistor is 30 V, and it can be programmed up to 47 V. 23 SW DMOS drain node. 25 VIN Input supply for the IC. Decouple with a 0.1 μF ceramic capacitor. 26 AGND Circuit ground pin.	4	FSET	Sets boost switching frequency. Connect RFSET from FSET to GND to set frequency. Range for RFSET is 13 to 40 kΩ.
APWWI dimming mode. When unused, connect to AGND.	5	ISET	
Second	6	APWM	
Second	7	LED1	
10 LED7 11 LGND Power ground pin for LED current sink. 12 LED8 13 LED6 14 LED4 15 LED2 16 SEL1 17 SEL2 SEL1, SEL2, and SEL3 decide active LED strings. 18 SEL3 19 EN On/off and serial dimming control. EN high enables IC and EN low disables IC. This pin can also be used to program LEDx current. When unused, connect to AGND. 20 PWM On/off and on/off LED current control with external PWM. Apply logic level PWM for PWM controlled dimming mode. When unused, connect to AGND. 21 PGND Power ground pin. 22 OVP Connect to this pin to output capacitor +Ve node through a resistor to enable OVP (overvoltage protection). Default OVF level with 0 Ω resistor is 30 V, and it can be programmed up to 47 V. 23 SW DMOS drain node. 25 VIN Input supply for the IC. Decouple with a 0.1 μF ceramic capacitor.	8	LED3	I EDV canable of 25 mA
11 LGND Power ground pin for LED current sink. 12 LED8 13 LED6 14 LED4 15 LED2 16 SEL1 17 SEL2 18 SEL3 19 EN On/off and serial dimming control. EN high enables IC and EN low disables IC. This pin can also be used to program LEDx current. When unused, connect to AGND. 20 PWM On/off and on/off LED current control with external PWM. Apply logic level PWM for PWM controlled dimming mode. When unused, connect to AGND. 21 PGND Power ground pin. 22 OVP Connect to this pin to output capacitor +Ve node through a resistor to enable OVP (overvoltage protection). Default OVF level with 0 Ω resistor is 30 V, and it can be programmed up to 47 V. 23 SW DMOS drain node. 25 VIN Input supply for the IC. Decouple with a 0.1 μF ceramic capacitor. 26 AGND Circuit ground pin.	9	LED5	LEDX capable of 25 mA.
12 LED8 13 LED6 14 LED4 15 LED2 16 SEL1 17 SEL2 18 SEL3 19 EN On/off and serial dimming control. EN high enables IC and EN low disables IC. This pin can also be used to program LEDx current. When unused, connect to AGND. 20 PWM On/off and on/off LED current control with external PWM. Apply logic level PWM for PWM controlled dimming mode. When unused, connect to AGND. 21 PGND Power ground pin. 22 OVP Connect to this pin to output capacitor +Ve node through a resistor to enable OVP (overvoltage protection). Default OVF level with 0 Ω resistor is 30 V, and it can be programmed up to 47 V. 23 SW DMOS drain node. 25 VIN Input supply for the IC. Decouple with a 0.1 μF ceramic capacitor. 26 AGND Circuit ground pin.	10	LED7	
13 LED6 14 LED4 15 LED2 16 SEL1 17 SEL2 18 SEL3 19 EN On/off and serial dimming control. EN high enables IC and EN low disables IC. This pin can also be used to program LEDx current. When unused, connect to AGND. 20 PWM On/off and on/off LED current control with external PWM. Apply logic level PWM for PWM controlled dimming mode. When unused, connect to AGND. 21 PGND Power ground pin. 22 OVP Connect to this pin to output capacitor +Ve node through a resistor to enable OVP (overvoltage protection). Default OVF level with 0 Ω resistor is 30 V, and it can be programmed up to 47 V. 23 SW DMOS drain node. 25 VIN Input supply for the IC. Decouple with a 0.1 μF ceramic capacitor.	11	LGND	Power ground pin for LED current sink.
14 LED4 15 LED2 16 SEL1 17 SEL2 18 SEL3 19 EN On/off and serial dimming control. EN high enables IC and EN low disables IC. This pin can also be used to program LEDx current. When unused, connect to AGND. 20 PWM On/off and on/off LED current control with external PWM. Apply logic level PWM for PWM controlled dimming mode. When unused, connect to AGND. 21 PGND Power ground pin. 22 OVP Connect to this pin to output capacitor +Ve node through a resistor to enable OVP (overvoltage protection). Default OVF level with 0 Ω resistor is 30 V, and it can be programmed up to 47 V. 23 SW DMOS drain node. 25 VIN Input supply for the IC. Decouple with a 0.1 μF ceramic capacitor.	12	LED8	
14 LED4 15 LED2 16 SEL1 17 SEL2 SEL1, SEL2, and SEL3 decide active LED strings. 18 SEL3 19 EN On/off and serial dimming control. EN high enables IC and EN low disables IC. This pin can also be used to program LEDx current. When unused, connect to AGND. 20 PWM When unused, connect to AGND. 21 PGND Power ground pin. 22 OVP Connect to this pin to output capacitor +Ve node through a resistor to enable OVP (overvoltage protection). Default OVF level with 0 Ω resistor is 30 V, and it can be programmed up to 47 V. 23 SW DMOS drain node. 25 VIN Input supply for the IC. Decouple with a 0.1 μF ceramic capacitor. 26 AGND Circuit ground pin.	13	LED6	I EDV canable of 25 mA
16 SEL1 17 SEL2 18 SEL3 19 EN On/off and serial dimming control. EN high enables IC and EN low disables IC. This pin can also be used to program LEDx current. When unused, connect to AGND. 20 PWM On/off and on/off LED current control with external PWM. Apply logic level PWM for PWM controlled dimming mode. When unused, connect to AGND. 21 PGND Power ground pin. 22 OVP Connect to this pin to output capacitor +Ve node through a resistor to enable OVP (overvoltage protection). Default OVF level with 0 Ω resistor is 30 V, and it can be programmed up to 47 V. 23 SW DMOS drain node. 25 VIN Input supply for the IC. Decouple with a 0.1 μF ceramic capacitor. 26 AGND Circuit ground pin.	14	LED4	LEDX capable of 23 ma.
17 SEL2 18 SEL1, SEL2, and SEL3 decide active LED strings. 19 EN On/off and serial dimming control. EN high enables IC and EN low disables IC. This pin can also be used to program LEDx current. When unused, connect to AGND. 20 PWM On/off and on/off LED current control with external PWM. Apply logic level PWM for PWM controlled dimming mode. When unused, connect to AGND. 21 PGND Power ground pin. 22 OVP Connect to this pin to output capacitor +Ve node through a resistor to enable OVP (overvoltage protection). Default OVF level with 0 Ω resistor is 30 V, and it can be programmed up to 47 V. 23 SW 24 SW DMOS drain node. 25 VIN Input supply for the IC. Decouple with a 0.1 μF ceramic capacitor. 26 AGND Circuit ground pin.	15	LED2	
18 SEL3 19 EN On/off and serial dimming control. EN high enables IC and EN low disables IC. This pin can also be used to program LEDx current. When unused, connect to AGND. 20 PWM On/off and on/off LED current control with external PWM. Apply logic level PWM for PWM controlled dimming mode. When unused, connect to AGND. 21 PGND Power ground pin. 22 OVP Connect to this pin to output capacitor +Ve node through a resistor to enable OVP (overvoltage protection). Default OVF level with 0 Ω resistor is 30 V, and it can be programmed up to 47 V. 23 SW DMOS drain node. 25 VIN Input supply for the IC. Decouple with a 0.1 μF ceramic capacitor. 26 AGND Circuit ground pin.	16	SEL1	
19 EN On/off and serial dimming control. EN high enables IC and EN low disables IC. This pin can also be used to program LEDx current. When unused, connect to AGND. 20 PWM On/off and on/off LED current control with external PWM. Apply logic level PWM for PWM controlled dimming mode. When unused, connect to AGND. 21 PGND Power ground pin. 22 OVP Connect to this pin to output capacitor +Ve node through a resistor to enable OVP (overvoltage protection). Default OVF level with 0 Ω resistor is 30 V, and it can be programmed up to 47 V. 23 SW DMOS drain node. 25 VIN Input supply for the IC. Decouple with a 0.1 μF ceramic capacitor. 26 AGND Circuit ground pin.	17	SEL2	SEL1, SEL2, and SEL3 decide active LED strings.
LEDx current. When unused, connect to AGND. On/off and on/off LED current control with external PWM. Apply logic level PWM for PWM controlled dimming mode. When unused, connect to AGND. PGND Power ground pin. Connect to this pin to output capacitor +Ve node through a resistor to enable OVP (overvoltage protection). Default OVF level with 0 Ω resistor is 30 V, and it can be programmed up to 47 V. SW DMOS drain node. VIN Input supply for the IC. Decouple with a 0.1 μF ceramic capacitor. AGND Circuit ground pin.	18	SEL3	
When unused, connect to AGND.	19	EN	LEDx current. When unused, connect to AGND.
22 OVP Connect to this pin to output capacitor +Ve node through a resistor to enable OVP (overvoltage protection). Default OVF level with 0 Ω resistor is 30 V, and it can be programmed up to 47 V. 23 SW 24 SW DMOS drain node. 25 VIN Input supply for the IC. Decouple with a 0.1 μF ceramic capacitor. 26 AGND Circuit ground pin.	20	PWM	
22	21	PGND	Power ground pin.
24 SW DMOS drain node. 25 VIN Input supply for the IC. Decouple with a 0.1 μF ceramic capacitor. 26 AGND Circuit ground pin.	22	OVP	Connect to this pin to output capacitor +Ve node through a resistor to enable OVP (overvoltage protection). Default OVP level with 0 Ω resistor is 30 V, and it can be programmed up to 47 V.
24 SW 25 VIN Input supply for the IC. Decouple with a 0.1 μF ceramic capacitor. 26 AGND Circuit ground pin.	23	SW	DMOS drain node
26 AGND Circuit ground pin.	24	SW	DIVIOS UI AIIT HOUE.
	25	VIN	Input supply for the IC. Decouple with a 0.1 μF ceramic capacitor.
- FP Exposed and Electrically connected to PGND and LGND; connect to PCR conner plane for heat transfer	26	AGND	Circuit ground pin.
The process pad. Electrically confidence to 1 Order and Eorde, confidence to 1 Ob copper plane for fleat transfer.	_	EP	Exposed pad. Electrically connectred to PGND and LGND; connect to PCB copper plane for heat transfer.

Package EC, 4×4 mm 26-Pin QFN/MLP
