

FEATURES

Designed for 210°C operation

Low noise

1 nV/ $\sqrt{\text{Hz}}$ input noise

45 nV/ $\sqrt{\text{Hz}}$ output noise

High CMRR

126 dB CMRR (minimum), $G = 100$

80 dB CMRR (minimum) to 5 kHz, $G = 1$

Excellent ac specifications

15 MHz bandwidth ($G = 1$)

1.2 MHz bandwidth ($G = 100$)

22 V/ μs slew rate

THD: 130 dB (1 kHz, $G = 1$)

Versatile

$\pm 4\text{ V}$ to $\pm 17\text{ V}$ dual supply

Gain set with single resistor ($G = 1$ to 1000)

Temperature range: -40°C to $+210^\circ\text{C}$

Known good die (KGD): these die are fully guaranteed to data sheet specifications

APPLICATIONS

Down-hole instrumentation

Harsh environment data acquisition

Exhaust gas measurements

Vibration analysis

GENERAL DESCRIPTION

The [AD8229-KGD](#) is an ultralow noise instrumentation amplifier designed for measuring small signals in the presence of large common-mode voltages and high temperatures.

The [AD8229-KGD](#) has been designed for high temperature operation. The process is dielectrically isolated to avoid leakage currents at high temperatures. The design architecture was chosen to compensate for the low V_{BE} voltages at high temperatures.

The [AD8229-KGD](#) excels at distinguishing tiny signals. It delivers industry leading 1 nV/ $\sqrt{\text{Hz}}$ input noise performance. The high CMRR of the [AD8229-KGD](#) prevents unwanted signals from corrupting the acquisition. The CMRR increases as the gain increases, offering high rejection when it is most needed.

The [AD8229-KGD](#) is one of the fastest instrumentation amplifiers available. Its current feedback architecture provides bandwidth that is quite high, even at high gains, for example, 1.2 MHz at $G = 100$. With the high bandwidth comes excellent distortion performance, allowing use in demanding applications such as vibration analysis.

FUNCTIONAL BLOCK DIAGRAM

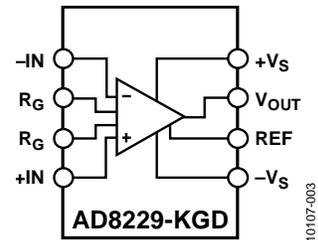

Figure 1.

10107-003

Gain is set from 1 to 1000 with a single resistor. A reference pin allows the user to offset the output voltage. This feature is useful when interfacing with analog-to-digital converters.

Additional application and technical information can be found in the [AD8229](#) standard product data sheet.

Quiescent Current			6.7	7	mA
High Temperature	T _A = 210°C			12	mA
TEMPERATURE RANGE					
For Specified Performance ⁵		-40		+210	°C

¹ Total Voltage Noise = $\sqrt{(e_{ni})^2 + (e_{no}/G)^2 + e_{RG}^2}$.

² These specifications do not include the tolerance of the external gain setting resistor, R_G. For G>1, R_G errors should be added to the specifications given in this table.

³ Differential and common-mode input impedance can be calculated from the pin impedance: Z_{DIFF} = 2(Z_{PIN}); Z_{CM} = Z_{PIN}/2.

⁴ Input voltage range of the AD8229-KGD input stage only. The input range can depend on the common-mode voltage, differential voltage, gain, and reference voltage.

⁵ Performance at 210°C is guaranteed for 1000 hours assuming that the maximum junction temperature listed in the Absolute Maximum Ratings, Table 2 is not exceeded.

ABSOLUTE MAXIMUM RATINGS

Table 2.

Parameter	Rating
Supply Voltage	$\pm 17\text{ V}$
Output Short-Circuit Current Duration	Indefinite
Maximum Voltage at $-IN$, $+IN$ ¹	$\pm V_S$
Differential Input Voltage ¹	
Gain ≤ 4	$\pm V_S$
$4 > \text{Gain} > 50$	$\pm 50\text{ V/gain}$
Gain ≥ 50	$\pm 1\text{ V}$
Maximum Voltage at REF	$\pm V_S$
Storage Temperature Range	-65°C to $+150^\circ\text{C}$
Specified Temperature Range	-40°C to $+210^\circ\text{C}$
Maximum Junction Temperature	245°C

¹For voltages beyond these limits, use input protection resistors.

Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

ESD CAUTION

ESD (electrostatic discharge) sensitive device. Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

PAD CONFIGURATION AND FUNCTION DESCRIPTIONS

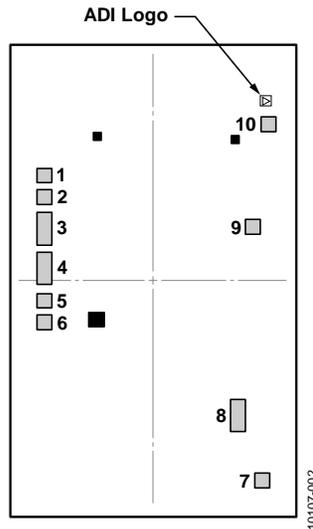

Figure 3. Pad Configuration

Table 3. Pad Function Descriptions¹

Pad No.	X-Axis (μm)	Y-Axis (μm)	Mnemonic	Pad Type	Description
1	-661	+665	-IN	Single	Negative Input Pad.
2	-661	+525	R_G	Single	Gain Setting Pad.
3	-661	+331	R_G	Double	Gain Setting Pad.
4	-661	+83	R_G	Double	Gain Setting Pad.
5	-661	-111	R_G	Single	Gain Setting Pad.
6	-661	-251	+IN	Single	Positive Input Pad.
7	+682	-1231	$-V_S$	Single	Negative Power Supply Pad.
8	+538	-839	REF	Double	Reference Voltage Pad.
9	+626	+337	V_{OUT}	Single	Output Pad.
10	+717	+979	$+V_S$	Single	Positive Power Supply Pad.

¹ To minimize gain errors introduced by the bond wires, use Kelvin connections between the chip and the gain resistor, R_G , by connecting Pad 2 and Pad 3 in parallel to one end of R_G , and connecting Pad 4 and Pad 5 in parallel to the other end of R_G . For unity-gain applications where R_G is not required, Pad 2 and Pad 3 must be bonded together as do Pad 4 and Pad 5.
