

20A/10A, 12V, 0.060/0.140 Ohm, Logic Level, Complementary Power MOSFET

These complementary power MOSFETs are manufactured using an advanced MegaFET process. This process, which uses feature sizes approaching those of LSI integrated circuits, gives optimum utilization of silicon, resulting in outstanding performance. It is designed for use in applications such as switching regulators, switching converters, motor drivers, relay drivers, and low voltage bus switches. This product achieves full rated conduction at a gate bias in the 3V to 5V range, thereby facilitating true on-off power control directly from logic level (5V) integrated circuits.

Formerly developmental type TA49092.

Ordering Information

PART NUMBER	PACKAGE	BRAND
RF3V49092	TS-001AA	F3V49092
RF3S49092SM	MO-169AB	F3S49092

NOTE: When ordering, use the entire part number. For ordering the MO-169AB in tape and reel, add the suffix 9A to the part number, i.e., RF3S49092SM9A.

Features

- 20A, 12V (N-Channel)
10A, 12V (P-Channel)
- $r_{DS(ON)} = 0.060\Omega$ (N-Channel)
 $r_{DS(ON)} = 0.140\Omega$ (P-Channel)
- Temperature Compensating PSPICE® Model
- On-Resistance vs Gate Drive Voltage Curves
- Peak Current vs Pulse Width Curve
- UIS Rating Curve

Symbol

Packaging

Soldering Precautions

The soldering process creates a considerable thermal stress on any semiconductor component. The melting temperature of solder is higher than the maximum rated temperature of the device. The amount of time the device is heated to a high temperature should be minimized to assure device reliability. Therefore, the following precautions should always be observed in order to minimize the thermal stress to which the devices are subjected.

1. Always preheat the device.
2. The delta temperature between the preheat and soldering should always be less than 100°C. Failure to preheat the device can result in excessive thermal stress which can damage the device.
3. The maximum temperature gradient should be less than 5°C per second when changing from preheating to soldering.
4. The peak temperature in the soldering process should be at least 30°C higher than the melting point of the solder chosen.
5. The maximum soldering temperature and time must not exceed 260°C for 10 seconds on the leads and case of the device.
6. After soldering is complete, the device should be allowed to cool naturally for at least three minutes, as forced cooling will increase the temperature gradient and may result in latent failure due to mechanical stress.
7. During cooling, mechanical stress or shock should be avoided.
