TL494, NCV494

SWITCHMODE™ Pulse Width Modulation Control Circuit

The TL494 is a fixed frequency, pulse width modulation control circuit designed primarily for SWITCHMODE power supply control.

Features

- Complete Pulse Width Modulation Control Circuitry
- On−Chip Oscillator with Master or Slave Operation
- On−Chip Error Amplifiers
- On−Chip 5.0 V Reference
- Adjustable Deadtime Control
- Uncommitted Output Transistors Rated to 500 mA Source or Sink
- Output Control for Push−Pull or Single−Ended Operation
- Undervoltage Lockout
- NCV Prefix for Automotive and Other Applications Requiring Site and Control Changes
- Pb−Free Packages are Available*

MAXIMUM RATINGS (Full operating ambient temperature range applies, unless otherwise noted.)

Rating	Symbol	Value	Unit
Power Supply Voltage	V_{CC}	42	V
Collector Output Voltage	V_{C1}, V_{C2}	42	V
Collector Output Current (Each transistor) (Note 1)	I_{C1}, I_{C2}	500	mA
Amplifier Input Voltage Range	V_{IR}	−0.3 to +42	V
Power Dissipation @ $T_A \le 45°C$	P_D	1000	mW
Thermal Resistance, Junction−to−Ambient	$R_{\theta JA}$	80	°C/W
Operating Junction Temperature	T_J	125	°C
Storage Temperature Range	T_{stg}	−55 to +125	°C
Operating Ambient Temperature Range TL494B TL494C TL494I NCV494B	T_A	 −40 to +125 0 to +70 −40 to +85 −40 to +125	°C
Derating Ambient Temperature	T_A	45	°C

Maximum ratings are those values beyond which device damage can occur. Maximum ratings applied to the device are individual stress limit values (not normal operating conditions) and are not valid simultaneously. If these limits are exceeded, device functional operation is not implied, damage may occur and reliability may be affected.

1. Maximum thermal limits must be observed.

*For additional information on our Pb−Free strategy and soldering details, please download the ON Semiconductor Soldering and Mounting Techniques Reference Manual, SOLDERRM/D.

ORDERING INFORMATION

See detailed ordering and shipping information in the package dimensions section on page 4 of this data sheet.

RECOMMENDED OPERATING CONDITIONS

Characteristics	Symbol	Min	Typ	Max	Unit
Power Supply Voltage	V_{CC}	7.0	15	40	V
Collector Output Voltage	V_{C1}, V_{C2}	−	30	40	V
Collector Output Current (Each transistor)	I_{C1}, I_{C2}	−	−	200	mA
Amplified Input Voltage	V_{in}	−0.3	−	V_{CC} − 2.0	V
Current Into Feedback Terminal	I_{fb}	−	−	0.3	mA
Reference Output Current	I_{ref}	−	−	10	mA
Timing Resistor	R_T	1.8	30	500	kΩ
Timing Capacitor	C_T	0.0047	0.001	10	μF
Oscillator Frequency	f_{osc}	1.0	40	200	kHz

ELECTRICAL CHARACTERISTICS (V_{CC} = 15 V, C_T = 0.01 μF, R_T = 12 kΩ, unless otherwise noted.)

For typical values T_A = 25°C, for min/max values T_A is the operating ambient temperature range that applies, unless otherwise noted.

Characteristics	Symbol	Min	Typ	Max	Unit
REFERENCE SECTION					
Reference Voltage (I_O = 1.0 mA)	V_{ref}	4.75	5.0	5.25	V
Line Regulation (V_{CC} = 7.0 V to 40 V)	Reg_{line}	−	2.0	25	mV
Load Regulation (I_O = 1.0 mA to 10 mA)	Reg_{load}	−	3.0	15	mV
Short Circuit Output Current (V_{ref} = 0 V)	I_{SC}	15	35	75	mA
OUTPUT SECTION					
Collector Off−State Current (V_{CC} = 40 V, V_{CE} = 40 V)	$I_{C(off)}$	−	2.0	100	μA
Emitter Off−State Current V_{CC} = 40 V, V_C = 40 V, V_E = 0 V)	$I_{E(off)}$	−	−	−100	μA
Collector−Emitter Saturation Voltage (Note 2) Common−Emitter (V_E = 0 V, I_C = 200 mA) Emitter−Follower (V_C = 15 V, I_E = −200 mA)	 $V_{sat(C)}$ $V_{sat(E)}$	 − −	 1.1 1.5	 1.3 2.5	V
Output Control Pin Current Low State ($V_{OC} \leq$ 0.4 V) High State (V_{OC} = V_{ref})	 I_{OCL} I_{OCH}	 − −	 10 0.2	 − 3.5	 μA mA
Output Voltage Rise Time Common−Emitter (See Figure 12) Emitter−Follower (See Figure 13)	t_r	 − −	 100 100	 200 200	ns
Output Voltage Fall Time Common−Emitter (See Figure 12) Emitter−Follower (See Figure 13)	t_f	 − −	 25 40	 100 100	ns

2. Low duty cycle pulse techniques are used during test to maintain junction temperature as close to ambient temperature as possible.

ELECTRICAL CHARACTERISTICS (V_{CC} = 15 V, C_T = 0.01 μF, R_T = 12 kΩ, unless otherwise noted.)
For typical values T_A = 25°C, for min/max values T_A is the operating ambient temperature range that applies, unless otherwise noted.

APPLICATIONS INFORMATION

Description

The TL494 is a fixed−frequency pulse width modulation control circuit, incorporating the primary building blocks required for the control of a switching power supply. (See Figure 1.) An internal−linear sawtooth oscillator is frequency− programmable by two external components, R_T and C_T. The approximate oscillator frequency is determined by:

$$f_{osc} \approx \frac{1.1}{R_T \bullet C_T}$$

For more information refer to Figure 3.

Output pulse width modulation is accomplished by comparison of the positive sawtooth waveform across capacitor C_T to either of two control signals. The NOR gates, which drive output transistors Q1 and Q2, are enabled only when the flip−flop clock−input line is in its low state. This happens only during that portion of time when the sawtooth voltage is greater than the control signals. Therefore, an increase in control−signal amplitude causes a corresponding linear decrease of output pulse width. (Refer to the Timing Diagram shown in Figure 2.)

The control signals are external inputs that can be fed into the deadtime control, the error amplifier inputs, or the feedback input. The deadtime control comparator has an effective 120 mV input offset which limits the minimum output deadtime to approximately the first 4% of the sawtooth−cycle time. This would result in a maximum duty cycle on a given output of 96% with the output control grounded, and 48% with it connected to the reference line. Additional deadtime may be imposed on the output by setting the deadtime−control input to a fixed voltage, ranging between 0 V to 3.3 V.

Functional Table

Input/Output Controls	Output Function	$\frac{f_{out}}{f_{osc}}$ =
Grounded	Single−ended PWM @ Q1 and Q2	1.0
@ V_{ref}	Push−pull Operation	0.5

The pulse width modulator comparator provides a means for the error amplifiers to adjust the output pulse width from the maximum percent on−time, established by the deadtime control input, down to zero, as the voltage at the feedback pin varies from 0.5 V to 3.5 V. Both error amplifiers have a common mode input range from −0.3 V to (V_{CC} − 2V), and may be used to sense power−supply output voltage and current. The error−amplifier outputs are active high and are ORed together at the noninverting input of the pulse−width modulator comparator. With this configuration, the amplifier that demands minimum output on time, dominates control of the loop.

When capacitor C_T is discharged, a positive pulse is generated on the output of the deadtime comparator, which clocks the pulse−steering flip−flop and inhibits the output transistors, Q1 and Q2. With the output−control connected to the reference line, the pulse−steering flip−flop directs the modulated pulses to each of the two output transistors alternately for push−pull operation. The output frequency is equal to half that of the oscillator. Output drive can also be taken from Q1 or Q2, when single−ended operation with a maximum on−time of less than 50% is required. This is desirable when the output transformer has a ringback winding with a catch diode used for snubbing. When higher output−drive currents are required for single−ended operation, Q1 and Q2 may be connected in parallel, and the output−mode pin must be tied to ground to disable the flip−flop. The output frequency will now be equal to that of the oscillator.

The TL494 has an internal 5.0 V reference capable of sourcing up to 10 mA of load current for external bias circuits. The reference has an internal accuracy of ±5.0% with a typical thermal drift of less than 50 mV over an operating temperature range of 0° to 70°C.
