

# NXP KMA215 sensor datasheet

<http://www.manuallib.com/nxp/kma215-sensor-datasheet.html>

The KMA215 is a magnetic angle sensor module with digital output in accordance with SAE J2716 JAN2010 Single Edge Nibble Transmission (SENT). The MagnetoResistive (MR) sensor bridges, the mixed signal Integrated Circuit (IC) and the required capacitors are integrated into a single package.

Manuallib.com collects and classifies the global product instruction manuals to help users access anytime and anywhere, helping users make better use of products.

# KMA215

## Programmable angle sensor with SAE J2716 SENT

Rev. 1 — 24 February 2014

Product data sheet

## 1. Product profile

### 1.1 General description

The KMA215 is a magnetic angle sensor module with digital output in accordance with SAE J2716 JAN2010 Single Edge Nibble Transmission (SENT). The MagnetoResistive (MR) sensor bridges, the mixed signal Integrated Circuit (IC) and the required capacitors are integrated into a single package.

This angular measurement module KMA215 is pre-programmed, pre-calibrated and therefore, ready to use. The default configuration for the digital output is SENT2010-03.0us-6dn-npp-nsp-A.3.

The KMA215 allows user-specific adjustments of angular range, zero angle and SENT configuration. The settings are stored in a multi-time programmable non-volatile memory.

### 1.2 Features and benefits

- High precision sensor for magnetic angular measurement
- Single package sensor module with integrated filters and pulse shaping for improved ElectroMagnetic Compatibility (EMC)
- Automotive qualified in accordance with AEC-Q100 Rev-G
- Programmable user adjustments, angular range, zero angle and SENT configuration
- Fail-safe non-volatile memory with write protection using lock bit
- Independent from magnetic field strength above 35 kA/m
- Ready to use without external components
- Factory calibrated
- High temperature range up to 160 °C
- Overvoltage protection up to 16 V
- Push pull output stage compliant with SAE J2716 JAN2010 SENT with pulse shaping
- Optional high-speed 12-bit SENT message format H.3
- Optional enhanced serial data communication
- Programming via One-Wire Interface (OWI)
- 8 user-programmable SENT messages (8 × 12 bit)
- Magnet-loss and broken bond wire detection

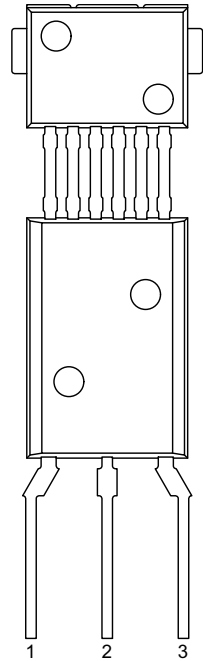

**1.2.1 Extract of SENT modes (shorthand notation)**

- SENT2010-03.0us-6dn-npp-nsp-A.3 (default configuration)
- SENT2010-03.0us-6dn-npp-esp-A.3
- SENT2010-03.0us-6dn-ppc(297.0)-nsp-A.3
- SENT2010-03.0us-6dn-ppc(297.0)-esp-A.3
- SENT2010-06.0us-6dn-npp-nsp-A.3
- SENT2010-06.0us-6dn-npp-esp-A.3
- SENT2010-06.0us-6dn-ppc(297.0)-nsp-A.3
- SENT2010-06.0us-6dn-ppc(297.0)-esp-A.3
- SENT201x-03.0us-4dn-npp-nsp-H.3
- SENT201x-03.0us-4dn-npp-esp-H.3

Additional SENT modes can be found in [Table 8](#), [Table 12](#) and [Table 15](#).

**2. Pinning information**

**Table 1. Pinning**

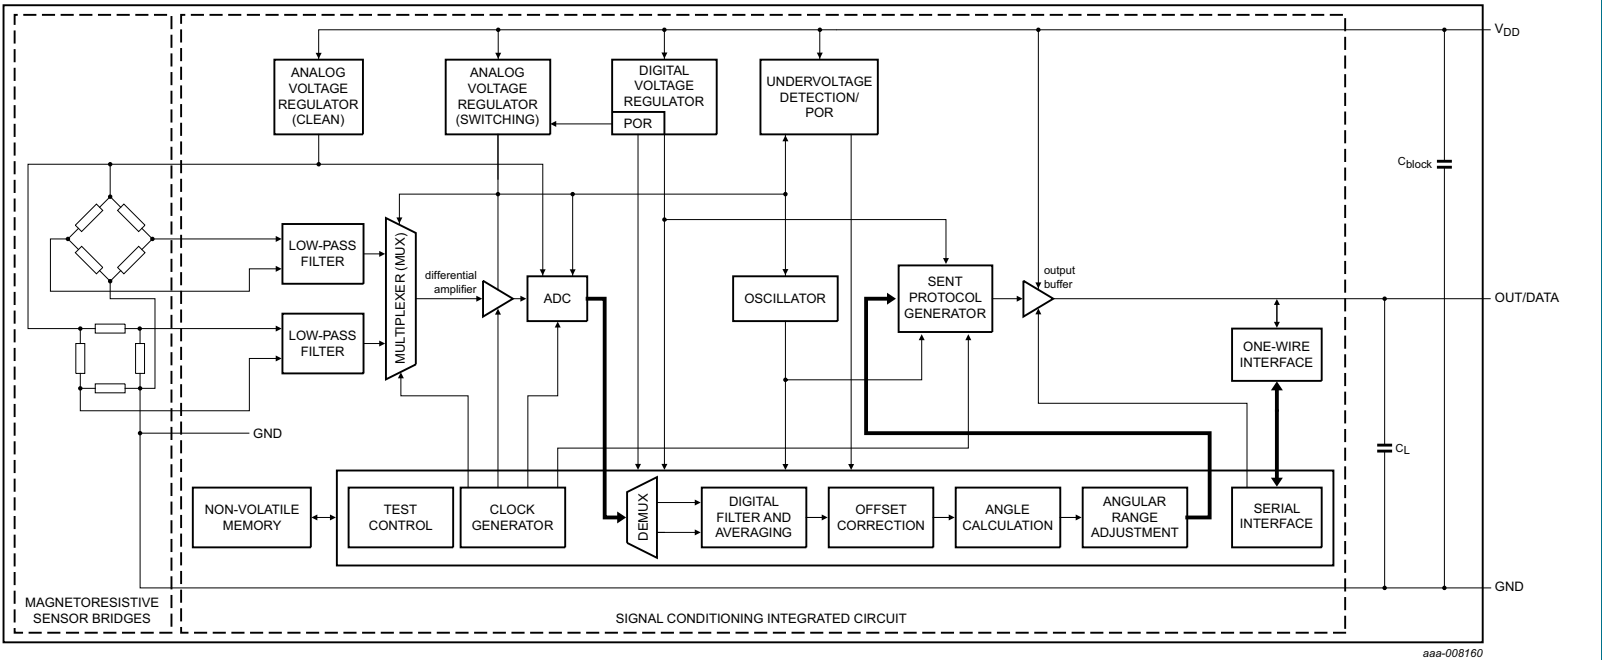

Pin	Symbol	Description	Simplified outline
1	V <sub>DD</sub>	supply voltage	
2	GND	ground	
3	OUT/DATA	SENT output or OWI data interface	

**3. Ordering information**

**Table 2. Ordering information**

Type number	Package		
	Name	Description	Version
KMA215	-	plastic single-ended multi-chip package; 6 interconnections; 3 in-line leads	SOT1288-2

4. Functional diagram

aaa-008160

Fig 1. Functional diagram of KMA215

## 5. Functional description

The KMA215 amplifies two orthogonal differential signals from MR sensor bridges and converts them into the digital domain. The angle is calculated using the COordinate Rotation DIgital Computer (CORDIC) algorithm and transmitted in a SENT frame compliant to SAE J2716 SENT standard. Zero angle and angular range are programmable. In addition, eight 12-bit Original Equipment Manufacturer (OEM) registers are available for customer purposes, such as sample identification.

The KMA215 comprises a Cyclic Redundancy Check (CRC) and an Error Detection and Correction (EDC) for the non-volatile memory. It also has magnet-loss and broken bond wire detection.

After multiplexing the two MR Wheatstone bridge signals and their successive amplification, the signal is converted into the digital domain by an Analog-to-Digital Converter (ADC). Further processing is done within an on-chip state machine. This state machine controls offset cancelation, calculation of the mechanical angle using the CORDIC algorithm, as well as zero angle and angular range adjustment. The SENT protocol generator converts the angular information into SENT messages that are repeatedly sent via the SENT output.

The configuration parameters are stored in a user-programmable non-volatile memory. The OWI (accessible using pin OUT/DATA) is used for accessing the memory. In order to protect the memory content, a lock bit can be set. After locking the non-volatile memory, its content cannot be changed anymore.

### 5.1 Angular measurement directions

The differential signals of the MR sensor bridges depend only on the direction of the external magnetic field strength  $H_{\text{ext}}$ , which is applied parallel to the plane of the sensor. In order to obtain a correct output signal, exceed the minimum saturation field strength.

Fig 2. Angular measurement directions

Since the Anisotropic MR (AMR) effect is periodic over 180°, the sensor output is also 180°-periodic. The angle is calculated relative to a freely programmable zero angle. The dashed line indicates the mechanical zero degree position.

## 6. Digital output

The KMA215 SENT provides a digital output signal on pin OUT/DATA compliant with the SAE J2716 JAN2010 SENT. The measured angle  $\alpha$  is converted linearly into a value, which is digital encoded in SENT frames. Either a positive or a negative angular slope characteristic is provided for this purpose.

[Table 3](#) describes the digital output behavior for a positive slope. A magnetic field angle above the programmed maximum angle  $\alpha_{max}$  but below the clamp switch angle  $\alpha_{sw(CL)}$  sets the output to the upper clamping value. If the magnetic field angle is larger than the clamp switch angle, the output value switches from upper to lower clamping value. If there is a negative slope, the clamping levels are changed.

Table 3. Digital output behavior for a positive slope

Magnetic field angle	Data value
$\alpha_{max} < \alpha < \alpha_{sw(CL)}$	CLAMP_HI
$\alpha_{sw(CL)} < \alpha < \alpha_{ref} + 180^\circ$	CLAMP_LO

### 6.1 Transmission of sensor messages

The KMA215 repeatedly sends a sequence of pulses based on the encoding scheme of SENT. The transmitted message is a sequence of 4-bit nibbles (SENT frame). The time base of the SENT frame is defined in clock ticks with a configurable duration of  $T_{\text{clk}} = 3.0 \mu\text{s}, 4.5 \mu\text{s}, 6.0 \mu\text{s}, 12.0 \mu\text{s}$  and  $24.0 \mu\text{s}$  each clock tick. A calibration pulse followed by a STATUS nibble, a constant number of DATA nibbles and a CRC nibble as shown in [Figure 4](#) define one message frame of a SENT transmission. The KMA215 supports the SENT data formats in accordance with the appendix A.1 and A.3 of the SAE J2716 JAN2010 SENT. Additionally a high-speed 12-bit message format H.3 is implemented.

General SENT specification can be found in:

- SAE J2716 FEB2008 SENT
- SAE J2716 JAN2010 SENT

### 6.1.1 SYNC nibble

The synchronization and calibration nibble is always 56 clock ticks long. The receiver uses the SYNC nibble to derive the clock tick time from the SENT frame.

### 6.1.2 STATUS nibble

The STATUS nibble contains status and slow channel information of the KMA215. Bit #0 reflects the operating mode of the KMA215, normal or diagnostic mode.

Bit #1 depends on the selected data format. If there is single secure sensor format A.3 or high-speed 12-bit message format H.3 selected, bit #1 of the STATUS nibble is a prewarning indication. Prewarning bit is set while the KMA215 is still in normal mode, but one of the following conditions occurred:

- Angular value is above the programmed OOR\_HI threshold; see [Table 32](#)
- Angular value is below the programmed OOR\_LO threshold; see [Table 32](#)
- Corrected single bit error of the non-volatile memory (can be disabled via SINGLE\_BIT\_ERROR\_PREWARNING bit in register Dh); see [Table 33](#)

If there is dual throttle position sensor format A.1 selected bit #1 behaves the same as bit #0. For detailed diagnostic information read out the ERROR\_BYTE of the optional slow channel serial message.

Bit #2 and bit #3 are used for optional slow channel serial data messages, described in [Section 6.1.6](#).

**Table 4. STATUS nibble**

Bit	Description
3 (MSB)	serial data message bit
2	serial data message bit
1	prewarning <sup>[1]</sup>
0 (LSB)	bit = 0: normal mode <sup>[2]</sup> bit = 1: diagnostic condition <sup>[2][3]</sup>

[1] The function of this bit depends on the selected data frame format. If there is A.1 selected this bit behaves like bit #0 of the STATUS nibble. If there is A.3 or H.3 selected this bit is an OR function of OOR\_HI, OOR\_LO and if enabled also ERROR\_CORRECT bit is included in the OR function.

[2] Copy of IN\_DIAG\_MODE bit of command register.

[3] Enable the serial data communication for detailed diagnostic information

### 6.1.3 CRC nibble

The CRC nibble contains the 4-bit checksum of the DATA nibbles only. The CRC calculation does not cover the STATUS nibble.

The CRC is calculated using polynomial  $x^4 + x^3 + x^2 + 1$  with seed value of 0101. The KMA215 supports both the legacy CRC defined in SENT SAE J2716 FEB2008 and earlier revisions and the recommended CRC defined in SENT SAE J2716 JAN2010. The CRC version can be selected via SENT\_LEGACY\_CRC bit in the SENT\_CONF register; see [Table 33](#). CRC in accordance with SAE J2710 JAN2010 is the default configuration.

6.1.4 PAUSE pulse

A PAUSE pulse can be optionally attended to the SENT frame to generate messages with a constant frame length of 297.0 clock ticks.

6.1.5 DATA nibbles

In general, the DATA nibbles contain the angular information of the KMA215. The data format depends on the selected sensor type. The KMA215 supports three different DATA nibble formats as defined in the SAE J2716 SENT specification:

- Single secure sensor format A.3
- Dual throttle position sensor format A.1
- High-speed 12-bit message format H.3

A detailed frame format description can be found in the corresponding subsection.

6.1.5.1 Single secure sensor format A.3

The KMA215 transmits the sequence defined in [Table 5](#) repeatedly in accordance with the single secure sensor format defined in SAE J2716 JAN2010 SENT appendix A.3. DATA nibbles D0 to D2 contain the 12-bit angular value. D3 and D4 reflect the value of an 8-bit loop counter. D5 is an inverted copy of the most significant nibble DATA0.

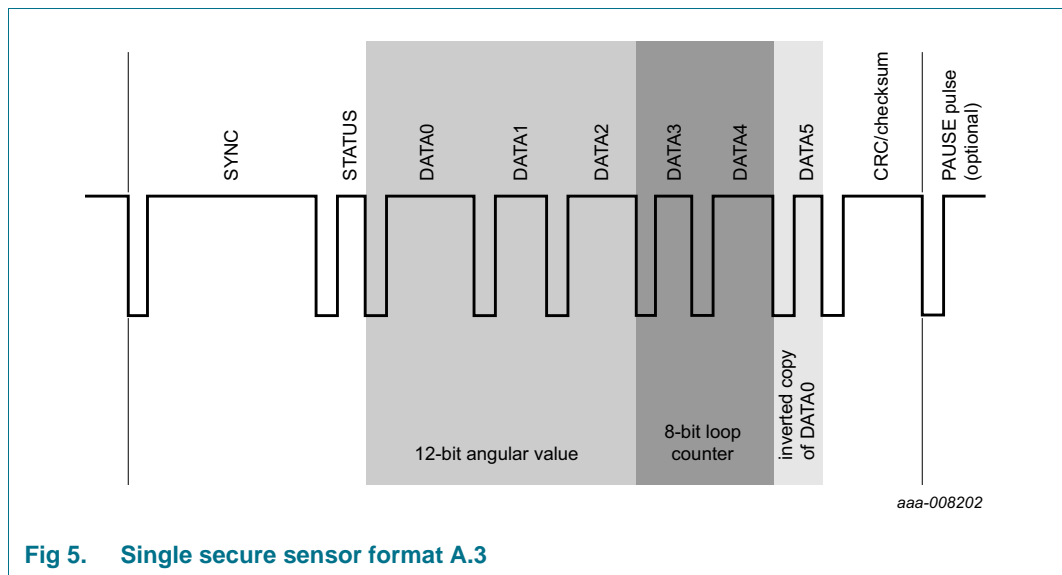

Fig 5. Single secure sensor format A.3

Table 5. Data content of single secure sensor format A.3 frame

SYNC	STATUS	DATA0	DATA1	DATA2	DATA3	DATA4	DATA5	CRC
-	error flag	D0 <sup>[1]</sup>	D1	D2 <sup>[2]</sup>	D3 <sup>[1]</sup>	D4 <sup>[2]</sup>	D5	-
-		12-bit angular value			8-bit loop counter		inverted D0	-

[1] Most Significant Nibble (MSN).

[2] Least Significant Nibble (LSN).

DATA nibbles D0 to D2 contain the angular value information in the single secure sensor format.

6.1.5.2 Dual throttle position sensor format A.1

The KMA215 transmits the sequence defined in Table 9 repeatedly in accordance with the dual throttle position sensor format defined in SAE J2716 JAN2010 SENT appendix A.1. DATA nibbles D0 to D2 contain the 12-bit angular value. DATA nibbles D3 to D5 contain the opposite slope of the same 12-bit angular value while also the order of these DATA nibbles is reversed.

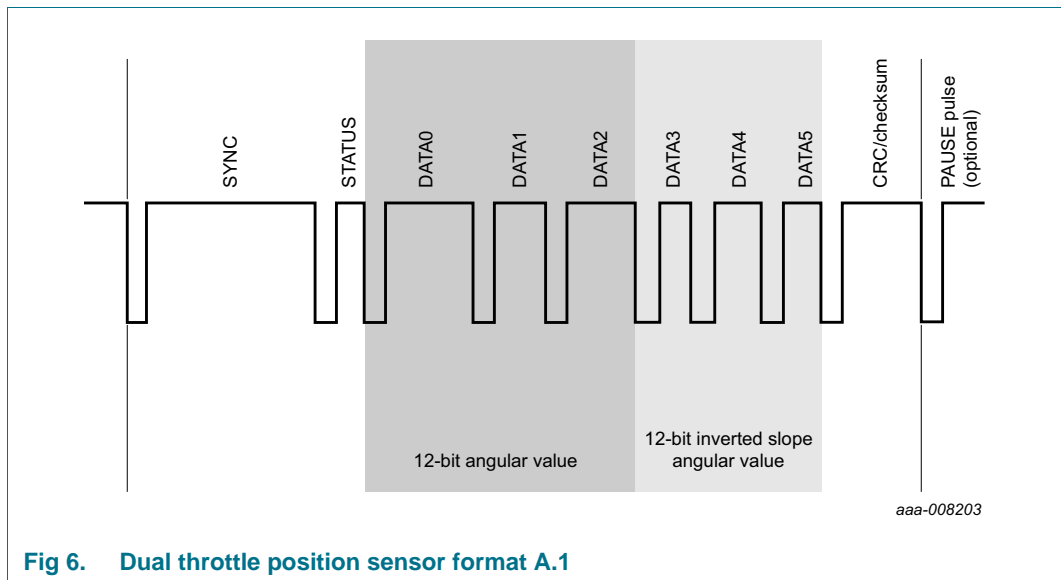

Fig 6. Dual throttle position sensor format A.1

Table 9. Data content of dual throttle position sensor format A.1 frame

SYNC	STATUS	DATA0	DATA1	DATA2	DATA3	DATA4	DATA5	CRC
-	error flag	D0 <sup>[1]</sup>	D1	D2 <sup>[2]</sup>	D5 <sup>[2]</sup>	D4	D3 <sup>[1]</sup>	-
-		12-bit angular value			12-bit inverted slope angular value			-

[1] MSN.

[2] LSN.

DATA nibbles D0 to D2 contain the angular value information in the dual throttle position sensor format.

Table 10. DATA nibbles D0 to D2: angular value

D0 <sup>[1]</sup>	D1	D2 <sup>[2]</sup>	12-bit value	Angle
0000	0000	0001	1	0°
:	:	:	:	:
1111	1111	1110	4094	$\alpha_{max}$

[1] MSN.

[2] LSN.

For the inverted slope angular value in the DATA nibbles DATA3 to DATA5 the order of the nibbles is also reversed: LSN, MidSN, MSN. When a diagnostic condition occurs, the DATA nibbles D0 to D2 are all set to Fh and DATA nibbles DATA3 to DATA5 are all set to 0h.

Table 11. DATA nibbles DATA[5:3]: inverted slope angular value

D5 <sup>[1]</sup>	D4	D3 <sup>[2]</sup>	12-bit value	Angle
0000	0000	0001	1	$\alpha_{\max}$
:	:	:	:	:
1111	1111	1110	4094	0°

[1] MSN.

[2] LSN.

For the dual throttle position sensor format A.1 clamping levels must be set to the correct values to comply to the SAE J2716 SENT specification. Otherwise angular values overwrite reserved data range for diagnostic information. The angular range multiplier and clamp switch angle must also be adapted thus the desired angular range is mapped to the remaining data range correctly.

Settings for dual throttle position sensor format A.1 180° full angular range; also see [Table 33](#):

CLAMP\_LO: 0001h

CLAMP\_HI: 0FFEh

ANG\_RNG\_MULT: 3FFFh

The KMA215 supports the A.1 dual throttle position sensor format in different configurations which can be programmed in the configuration register. Shorthand notations of available configurations and corresponding SENT mode register values are listed in [Table 12](#).

Table 12. Dual throttle position sensor format configurations

Shorthand notation	SENT mode	SENT release	Clock tick time	DATA nibbles	PAUSE pulse	Serial message	Data format

6.1.5.3 High-speed 12-bit message format H.3

The KMA215 supports a special high-speed 12-bit message format mode that realizes almost a doubling of the update rate compared to the other modes. The increase of the update rate is achieved by transmitting 12-bit angular data with only four DATA nibbles using only 3 bit of the available 4 bit per nibble. The MSB of each nibble is always zero. Additionally, the clock tick length is reduced to 2.7 μs typically with a maximum variation of ±10 %. The SYNC, STATUS and CRC nibble and the serial communication are the same as in the other modes described in Section 6.1.5.1. A PAUSE pulse option is not available for the high-speed 12-bit message format. The high-speed 12-bit message format H.3 complies to the SAE J2716 JAN2010 standard.

Fig 7. Example encoding scheme for a high-speed 12-bit frame

Table 13. Data content of high-speed 12-bit message format frame

SYNC	STATUS	DATA0	DATA1	DATA2	DATA3	CRC
-	error flag	D0 <sup>[1]</sup>	D1	D2	D3 <sup>[2]</sup>	-
-		12-bit angular value				-

[1] MSN.

[2] LSN.

To limit the total message length below 500 μs respectively 550 μs with serial data communication some data values are reserved as described in Table 14.

**Table 14. DATA nibbles D0 to D3: angular value**

The MSB of each nibble is always zero.

D0 <sup>[1]</sup>	D1	D2	D3 <sup>[2]</sup>	12-bit value	Angle
0000	0000	0000	0000	0	initialization; the initialization message is transmitted during the sensor initialization phase until valid value is available
0000	0000	0000	0001	1	0°
:	:	:	:	:	:
0111	0111	0111	0000	4088	$\alpha_{\max}$
0111	0111	0111	0001	4089	reserved
0111	0111	0111	0010	4090	diagnostic condition <sup>[3]</sup>
0111	0111	0111	0011	4091	reserved
0111	0111	0111	0100	4092	reserved
0111	0111	0111	0101	4093	reserved

0111	0111	0111	0111	4095	reserved

[1] MSN.

[2] LSN.

[3] For detailed diagnostic information, the serial data communication can be enabled.

For the 12-bit high-speed mode H.3 clamping levels must be set to the correct values to comply to the SAE J2716 SENT specification. Otherwise angular values overwrite reserved data range for diagnostic information. The angular range multiplier and clamp switch angle must also be adapted thus the desired angular range is mapped to the remaining data range correctly.

Settings for high-speed 12-bit fast mode 180° full angular range; also see [Table 33](#):

CLAMP\_LO: 0001h

CLAMP\_HI: 0FF8h

ANG\_RNG\_MULT: 3FE0h

The KMA215 supports the high-speed 12-bit message format H.3 in different configurations which can be programmed in the configuration register. Shorthand notations of available configurations are listed in [Table 15](#).

**Table 15. High-speed 12-bit message format H.3 configurations**

Shorthand notation	SENT mode	SENT release	Clock tick time	DATA nibbles	PAUSE pulse	Serial message	Data format

SENT201x-03.0us-4dn-npp-esp-H.3	21h	201x	3.0 $\mu$ s <sup>[1]</sup>	4	no	yes	H.3

[1] 2.7  $\mu$ s  $\pm$  10 %.

### 6.1.6 Enhanced serial data communication

Beside the normal message transmission also a slow serial data communication is realized using bit #2 and bit #3 of the STATUS nibble. The slow channel message stretches over 18 consecutive SENT frames and contains MR sensor bridge temperature, diagnostic/status information and user-programmable messages. These messages comply with the enhanced serial data message format with 8-bit message ID and 12-bit message data described in the SAE J2716 JAN2010 SENT specification.

[Table 16](#) shows the serial message cycle that is constantly repeated when enhanced serial data communication is enabled.

**Table 16. Serial message schedule**

Message number in serial message cycle	8-bit message ID	Definition	Comment
1	01h	diagnostic status code	
2	23h	ambient temperature	
3	03h	channel 1/2 sensor type	
4	05h	manufacturer code	
5	06h	SENT standard revision	
6	23h	ambient temperature	
7	90h	OEM CODE #1	user-programmable data content
8	91h	OEM CODE #2

Table 18. ERROR BYTE - data content

Bit	Symbol	Description
7 (MSB)	-	reserved
6	-	reserved
5	ERR_CORRECT	corrected single-bit error
4	BROKEN_BOND_DET	broken bond wire detected
3	-	reserved
2	-	reserved
1	-	reserved
0 (LSB)	MAGNET_LOSS_DET	magnet-loss detected

## 7. Diagnostic features

The KMA215 provides several diagnostic features:

### 7.1 CRC and EDC supervision

The KMA215 includes a supervision of the programmed data. At power-on, a CRC of the non-volatile memory is performed. Furthermore the memory is protected against bit errors. Every 16-bit data word is saved internally as a 22-bit word for this purpose. The protection logic corrects any single-bit error in a data word, while the sensor continues in normal operation mode. Furthermore the logic detects double-bit error per word and switches the output into diagnostic mode.

If there is a CRC error or double-bit error of the non-volatile memory a correct SENT configuration cannot be guaranteed anymore thus the output is set to LOW.

### 7.2 Magnet-loss detection

If the applied magnetic field strength is not sufficient, the KMA215 can raise a diagnostic condition. In order to enter the diagnostic mode, due to magnet-loss, enable the detection first. The magnet-loss information is then stored in the command register.

### 7.3 Broken bond wire detection

The broken bond wire detection circuit enables the detection of an interrupted supply or ground line of the MR sensor bridge. If there is a broken bond wire, the corresponding status bit of the command register is set.

## 7.4 Out of range detection

The KMA215 can be programmed to raise a diagnostic condition if the angular data value exceeds a programmable data range. If the angular data is above the OOR\_THRESHOLD\_HI value, the OOR\_HI bit of command register is set. If the angular data is below the OOR\_THRESHOLD\_LO value, the OOR\_LO bit of command register is set. These bits are reset if the signal is back in the programmed range.

## 7.5 Prewarning indication

Bit #1 of the STATUS nibble is a prewarning indication. While the KMA215 is still in normal operation, this bit is set if one of the following conditions occurs:

- The angular data is above the OOR\_THRESHOLD\_HI value thus the OOR\_HI bit is set
- The angular data is below the OOR\_THRESHOLD\_LO value thus the OOR\_LO bit is set
- Optional: A single bit error of the non-volatile memory was corrected and the ERR\_CORRECT bit is set. The indication of the single-bit error via prewarning indication in the SENT message can be disabled in the command register

## 7.6 Low voltage detection and overvoltage protection

If the supply voltage is below the switch-off threshold voltage  $V_{th(off)}$  or above the overvoltage threshold  $V_{th(ov)}$  voltage, the output is set to LOW. [Table 19](#) describes the system behavior depending on the voltage range of the supply voltage.

**Table 19. System behavior**

Supply voltage	State	Description
0 V to $\cong 1.8$ V	start-up power	high-ohmic output stage; external pull-up resistor defines output voltage
$\cong 1.8$ V to $V_{POR}$	power-on reset	The output buffer drives an active LOW. During the reset phase, all circuits are in reset and/or Power-down mode.
$V_{POR}$ to $V_{th(on)}$ or $V_{th(off)}$	initialization	The digital core and the oscillator are active. After reset, the content of the non-volatile memory is copied into the shadow registers. The output buffer drives an active LOW.
$V_{th(on)}$ or $V_{th(off)}$ to minimum $V_{DD}$	functional operation	All analog circuits are active and the output is set to HIGH for at least 100 $\mu$ s before SENT transmission starts. Not all parameters are within the specified limits.
Minimum $V_{DD}$ to maximum $V_{DD}$	normal operation	All analog circuits are active and the measured angle is available at the digital output. All parameters are within the specified limits.
Maximum $V_{DD}$ to $V_{th(ov)}$	functional operation	All analog circuits are active and the measured angle is available at the digital output. Not all parameters are within the specified limits.
$V_{th(ov)}$ to 16 V	overvoltage	The digital core and the oscillator are active but all other circuits are in Power-down mode. The output buffer drives an active LOW.

[Table 20](#) describes the diagnostic behavior and the resulting error flag in the command register depending on the error case. Furthermore the duration and termination condition to enter and leave the diagnostic condition are given, respectively.

Table 20. Diagnostic behavior

Diagnostic condition	Error bit in command register	STATUS nibble in SENT message	Output behavior	Duration	Termination condition
Low voltage <sup>[1]</sup>	LOW_VOLTAGE_DET	n/a	output set to LOW	40 μs < t < 120 μs	functional or normal operation
Overvoltage	n/a	n/a	output set to LOW	40 μs < t < 120 μs	functional or normal operation
Single-bit error	ERR_CORRECT	optional: prewarning bit if enabled	diagnostic status code message in Enhanced Serial Protocol (ESP) <sup>[2]</sup>	n/a	power-on reset <sup>[3]</sup>
Double-bit error	UNCORR_ERR	n/a	output set to LOW	n/a	power-on reset <sup>[3]</sup>
Magnet-loss	MAGNET_LOSS_DET	diagnostic bit	diagnostic status code message in ESP <sup>[2]</sup>	2.5 ms < t < 6 ms	magnet present <sup>[3]</sup>
Broken bond wire	BROKEN_BOND_DET	diagnostic bit	diagnostic status code message in ESP <sup>[2]</sup>	0.2 ms < t < 1 ms	power-on reset <sup>[3]</sup>
Signal out of range HIGH	OOR_HI	prewarning bit	diagnostic status code message in ESP <sup>[2]</sup>	2.5 ms < t < 6 ms	signal in range
Signal out of range LOW	OOR_LO	prewarning bit	diagnostic status code message in ESP <sup>[2]</sup>	2.5 ms < t < 6 ms	signal in range

[1] Supply voltage drops below functional operation range longer than 80 μs (typical value) initiate a start-up sequence including diagnostic LOW at the digital output. Supply voltage drops down to 2.3 V (typical value) shorter than 5 μs (typical value) abort the transmission of the current SENT frame. A new SENT frame is started within 400 μs after supply voltage returns to levels higher than the switch-on threshold voltage  $V_{th(on)}$ . If applicable, the loop counter value of the single secure sensor protocol frame is incremented by 12 to indicate this short voltage drop at the supply. If applicable, the enhanced serial message is also restarted.

[2] Enhanced serial protocol must be enabled to transmit diagnostic message.

[3] Status bit stays set in command register until power-on reset.

## 7.7 Power-loss behavior

If there is ground or power-loss the output becomes high-ohmic and the external pull-up resistor of the SENT receiver circuit defines the OUT/DATA voltage level.

If there is ground-loss the output goes to supply level without oscillation.

If there is power-loss there is still a connection to the supply voltage via the external pull-up resistor of the SENT receiver circuit. When the voltage between  $V_{DD}$  and GND becomes less than  $V_{th(off)}$ , the output goes to diagnostic LOW. At lower supply voltages, below  $V_{POR}$ , the output becomes high-ohmic and is pulled up by the external resistor.

## 8. Limiting values

**Table 21. Limiting values**

*In accordance with the Absolute Maximum Rating System (IEC 60134).*

Symbol	Parameter	Conditions	Min	Max	Unit
$V_{DD}$	supply voltage		-0.3	+16	V
$V_O$	output voltage		-0.3	+16	V
$V_{O(ov)}$	overvoltage output voltage	$T_{amb} < 140\text{ °C}$ at $t < 1\text{ h}$	[1] $V_{th(ov)}$	16	V
$I_r$	reverse current	$T_{amb} < 70\text{ °C}$	-	150	mA
$T_{amb}$	ambient temperature		-40	+160	°C
$T_{amb(pr)}$	programming ambient temperature		10	70	°C
$T_{stg}$	storage temperature		-40	+125	°C
<b>Non-volatile memory</b>					
$t_{ret(D)}$	data retention time	$T_{amb} = 50\text{ °C}$	17	-	year
$N_{endu(W\_ER)}$	write or erase endurance	$T_{amb(pr)} = 70\text{ °C}$	100	-	cycle

[1] Overvoltage on digital output and supply within the specified operating voltage range.

## 9. Recommended operating conditions

**Table 22. Operating conditions**

*In a homogenous magnetic field.*

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$V_{DD}$	supply voltage		[1] 4.5	5.0	5.25	V
$T_{amb}$	ambient temperature		-40	-	+160	°C
$T_{amb(pr)}$	programming ambient temperature		10	-	70	°C
$R_{L(pu)}$	pull-up load resistance		10	-	55	kΩ
$C_{L(ext)}$	external load capacitance		[1][2][3] 0	-	3.5	nF
			[2][4] 0	-	6.8	nF
$H_{ext}$	external magnetic field strength		35	-	-	kA/m

[1] Normal operation mode.

[2] Between ground and digital output.

[3] W/o internal load capacitor  $C_L$ ; part of capacity is defined as input capacitor inside receiver circuit according to SENT specification; also see application information in [Section 16](#).

[4] Command mode.

## 10. Thermal characteristics

**Table 23. Thermal characteristics**

Symbol	Parameter	Conditions	Typ	Unit
$R_{th(j-a)}$	thermal resistance from junction to ambient		145	K/W

## 11. Characteristics

**Table 24. Supply current**

Characteristics are valid for the operating conditions, as specified in [Section 9](#).

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
I <sub>DD</sub>	supply current		[1][2] 5	-	12	mA
			[3] -	-	14	mA
I <sub>DD(ripple)</sub>	ripple supply current	peak-to-peak value	-	1	2	mA
I <sub>off(ov)</sub>	overvoltage switch-off current		[4] -	-	7	mA
I <sub>O(sc)</sub>	short-circuit output current		[5] -	-	37	mA

[1] Normal operation excluding overvoltage and undervoltage within the specified operating supply voltage range.

[2] Without load current at the digital output.

[3] Normal operation and diagnostic mode over full voltage range up to limiting supply voltage at steady state.

[4] Diagnostic mode for a supply voltage above the overvoltage threshold voltage up to the limiting supply voltage.

[5] If OUT/DATA is shorted to GND or V<sub>DD</sub>, respectively.

**Table 25. Power-on reset**

Characteristics are valid for the operating conditions, as specified in [Section 9](#).

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
V <sub>th(on)</sub>	switch-on threshold voltage	SENT transmission, if V <sub>DD</sub> > V <sub>th(on)</sub>	-	4.30	4.45	V
V <sub>th(off)</sub>	switch-off threshold voltage	digital output set to LOW, if V <sub>DD</sub> < V <sub>th(off)</sub>	3.90	4.10	-	V
V <sub>hys</sub>	hysteresis voltage	V <sub>hys</sub> = V <sub>th(on)</sub> - V <sub>th(off)</sub>	0.1	0.2	-	V
V <sub>POR</sub>	power-on reset voltage	IC is initialized	-	3.3	3.6	V
V <sub>th(ov)</sub>	overvoltage threshold voltage	digital output set to LOW, if V <sub>DD</sub> > V <sub>th(ov)</sub>	6.5	7.5	8.0	V
V <sub>hys(ov)</sub>	overvoltage hysteresis voltage		0.1	0.3	-	V

$C_{block}$	blocking capacitance		[1] 50	100	150	nF
$C_L$	load capacitance		[1] 1.1	2.2	3.3	nF

[1] Measured at 1 MHz.

## 12. Definition of errors

### 12.1 General

Angular measurement errors by the KMA215 result from linearity errors, temperature drift errors and hysteresis errors. [Figure 9](#) shows the output signal of an ideal sensor, where the measured angle  $\phi_{meas}$  corresponds ideally to the magnetic field angle  $\alpha$ . This curve represents the angle reference line  $\phi_{ref}(\alpha)$  with a slope of 0.01°/LSB.

The angular range is set to  $\alpha_{max} = 180^\circ$  for a valid definition of errors.

### 12.2 Hysteresis error

The device output performs a positive (clockwise) rotation and negative (counter clockwise) rotation over an angular range of 180° at a constant temperature. The maximum difference between the angles defines the hysteresis error  $\Delta\phi_{hys}$ .

[Equation 1](#) gives the mathematical description for the hysteresis value  $\Delta\phi_{hys}$ :

$$\Delta\phi_{hys}(\alpha) = |\phi_{meas}(\alpha \rightarrow 180^\circ) - \phi_{meas}(\alpha \rightarrow 0^\circ)| \tag{1}$$

### 12.3 Linearity error

The KMA215 output signal deviation from a best straight line  $\phi_{BSL}$ , with the same slope as the reference line, is defined as linearity error. The magnetic field angle is varied at fixed temperatures for measurement of this linearity error. The output signal deviation from the best straight line at the given temperature is the linearity error  $\Delta\phi_{lin}$ . It is a function of the magnetic field angle  $\alpha$  and the temperature of the device  $T_{amb}$ .

Fig 11. Definition of the linearity error

### 12.4 Microlinearity error

$\alpha$  is the magnetic field angle. If  $\Delta\alpha = 1^\circ$ , the microlinearity error  $\Delta\phi_{\mu lin}$  is the device output deviation from  $1^\circ$ .

Fig 12. Definition of the microlinearity error

### 12.5 Temperature drift error

The temperature drift  $\Delta\phi_{temp}$  is defined as the envelope over the deviation of the angle versus the temperature range. It is considered as the pure thermal effect.

[Equation 2](#) gives the mathematical description for temperature drift value  $\Delta\phi_{temp}$ :

$$\Delta\phi_{temp}(\alpha) = |\phi_{meas}(\alpha, T_x) - \phi_{meas}(\alpha, T_y)| \tag{2}$$

with:

$T_x$ : temperature for maximum  $\phi_{meas}$  at angle  $\alpha$

$T_y$ : temperature for minimum  $\phi_{meas}$  at angle  $\alpha$

The deviation from the value at room temperature  $\Delta\phi_{temp}|_{RT}$  describes the temperature drift of the angle, compared to the value, which the sensor provides at room temperature:

$$\Delta\phi_{temp}|_{RT}(\alpha, T_{amb}) = |\phi_{meas}(\alpha, T_{amb}) - \phi_{meas}(\alpha, T_{RT})| \tag{3}$$

with:

$T_{RT}$ : room temperature (25 °C)

### 12.6 Angular error

The angular error  $\Delta\phi_{ang}$  is the difference between mechanical angle and sensor output during a movement from  $\alpha_0$  to  $\alpha_1$ . Here  $\alpha_0$  and  $\alpha_1$  are arbitrary angles within the angular range. The customer initially programs the angle measurement at  $\alpha_0$  at room temperature and zero hour upon production. The angle measurement at  $\alpha_1$  is made at any temperature within the ambient temperature range:

$$\Delta\phi_{ang} = (\phi_{meas}(\alpha_1, T_{amb}) - \phi_{meas}(\alpha_0, T_{RT})) - (\alpha_1 - \alpha_0) \tag{4}$$

with:

$\alpha_0, \alpha_1$ : arbitrary mechanical angles within the angular range

$\phi_{meas}(\alpha_0, T_{RT})$ : programmed angle at  $\alpha_0, T_{RT} = 25\text{ °C}$  and zero hour upon production

$\phi_{meas}(\alpha_1, T_{amb})$ : the sensor measures angle at  $\alpha_1$  and any temperature within  $T_{amb}$

This error comprises non-linearity and temperature drift related to the room temperature.

Fig 14. Envelope curve for the magnitude of angular error

Figure 14 shows the envelope curve for the magnitude of angular error  $|\Delta\phi_{ang}|$  versus  $\alpha_1$  for all angles  $\alpha_0$  and all temperatures  $T_{amb}$  within the ambient temperature range. If  $\alpha_1$  is in the range of  $\pm 1^\circ$  around  $\alpha_0$ ,  $|\Delta\phi_{ang}|$  has its minimum. Here only the microlinearity error  $\Delta\phi_{\mu lin}$  and the temperature drift related to the room temperature  $|\Delta\phi_{temp}|_{RT}$  occurs. If  $\alpha_1$  deviates from  $\alpha_0$  by more than  $1^\circ$  in either direction,  $|\Delta\phi_{ang}|$  can increase. Slope  $m_{ang}$  defines the gradient.

Equation 5 to Equation 8 express the angular error:

for  $|\alpha_1 - \alpha_0| \leq 1^\circ$

$$|\Delta\phi_{ang}| = |\Delta\phi_{\mu lin} + \Delta\phi_{temp}|_{RT}| \tag{5}$$

for  $1^\circ < |\alpha_1 - \alpha_0| < \alpha^*$

$$|\Delta\phi_{ang}| = |\Delta\phi_{\mu lin} + \Delta\phi_{temp}|_{RT}| + m_{ang} \times (|\alpha_1 - \alpha_0| - 1^\circ) \tag{6}$$

for  $|\alpha_1 - \alpha_0| \geq \alpha^*$

$$|\Delta\phi_{ang}| = \sqrt{(\Delta\phi_{lin})^2 + (\Delta\phi_{temp}|_{RT})^2} \tag{7}$$

with:

$$\alpha^* = \frac{|\Delta\phi_{ang(peak)}| - |\Delta\phi_{\mu lin} + \Delta\phi_{temp}|_{RT}|}{m_{ang}} + \alpha_0 + 1^\circ \tag{8}$$

## 13. Programming

### 13.1 General description

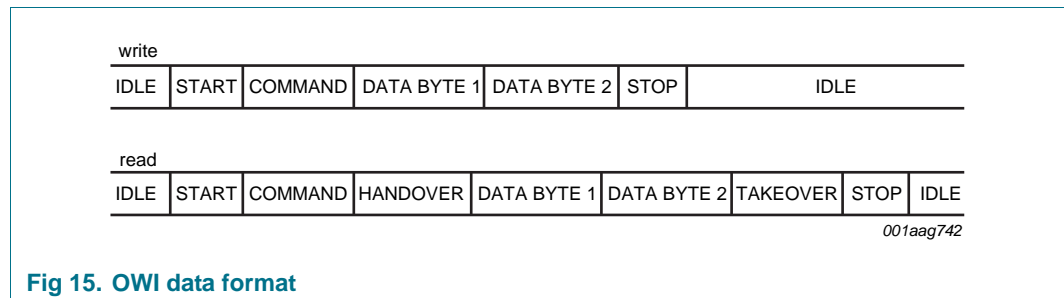

The KMA215 provides an OWI to enable programming of the device which uses pin OUT/DATA bidirectionally.

In general the device runs in digital output mode, the normal operation mode. The embedded programming data configures this mode. After a power-on reset once time  $t_{on}$  has elapsed, it starts. In this mode, the magnetic field angle is repeatedly transmitted with SENT protocol.

A second mode, the command mode enables programming. In this mode, the customer can adjust all required parameters (for example zero angle, angular range, SENT configurations) to meet the application requirements. The data is stored in the non-volatile memory. After changing the contents of the memory, recalculate and write the checksum (see [Section 13.4](#)).

In order to enter the command mode, keep OUT/DATA pin HIGH for at least  $t_{to}$  and send a specific command sequence after a power-on reset and during the time slot  $t_{cmd(ent)}$ . The external source used to send the command sequence must overdrive the output buffer of the KMA215. In doing so, it provides current  $I_{od}$ .

During communication, the KMA215 is always the slave and the external programming hardware is always the master. [Figure 15](#) illustrates the structure of the OWI data format.

**Fig 15. OWI data format**

The master provides the start condition, which is a rising edge after a LOW level. Then a command byte which can be either a read or a write command is sent. Depending on the command, the master or the slave has to send the data immediately after the command sequence. If there is a read command, an additional handover or takeover bit is inserted before and after the data bytes. The master must close each communication with a stop condition. If the slave does not receive a rising edge for a time longer than  $t_{to}$ , a time-out condition occurs. The bus is reset to the idle state and waits for a start condition and a new command. This behavior can be used to synchronize the device regardless of the previous state.

All communication is based on this structure (see [Figure 15](#)), even for entering the command mode. In this case, the write command 94h and the signature are required. The customer can access the non-volatile memory, CTRL1, TESTCTRL0 and SIGNATURE registers (described in [Section 13.5](#)). Only a power-on reset leaves the command mode. A more detailed description of the programming is given in the next sections.

### 13.2 Timing characteristics

As described in the previous section, a start and stop condition is necessary for communication. The LOW-level duration before the rising edge of the start condition is defined as  $t_{start}$ . The HIGH-level duration after the rising edge of the stop condition is defined as  $t_{stop}$ . These parameters, together with all other timing characteristics are shown in [Table 28](#).

Fig 16. OWI start and stop condition

[Figure 17](#) shows the coding of a single bit with a HIGH level of  $V_{IH}$  and a LOW level of  $V_{IL}$ . Here the pulse width  $t_{w1}$  or  $t_{w0}$  represents a logic 1 or a logic 0 of a full bit period  $T_{bit}$ , respectively.

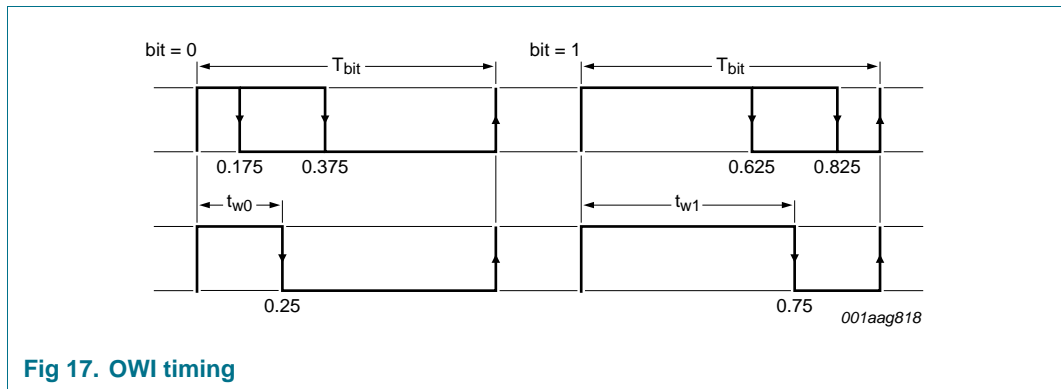

Fig 17. OWI timing

### 13.3 Sending and receiving data

The master has to control the communication during sending or receiving data. The command byte defines the region, address and type of command the master requests. Read commands need an additional handover or takeover bit. Insert this bit before and after the two data bytes (see [Figure 15](#)). However the OWI is a serial data transmission, whereas the Most Significant Byte (MSB) send at first.

Table 30. Format of a command byte

7	6	5	4	3	2	1	0
CMD7	CMD6	CMD5	CMD4	CMD3	CMD2	CMD1	CMD0

Table 31. Command byte bit description

Bit	Symbol	Description
7 to 5	CMD[7:5]	region bits
		000 = 16-bit non-volatile memory
		001 to 011 = reserved
		100 = 16-bit register
		101 to 111 = reserved

**Table 31. Command byte bit description ...continued**

Bit	Symbol	Description
4 to 1	CMD[4:1]	address bits
0	CMD0	read/write
		0 = write
		1 = read

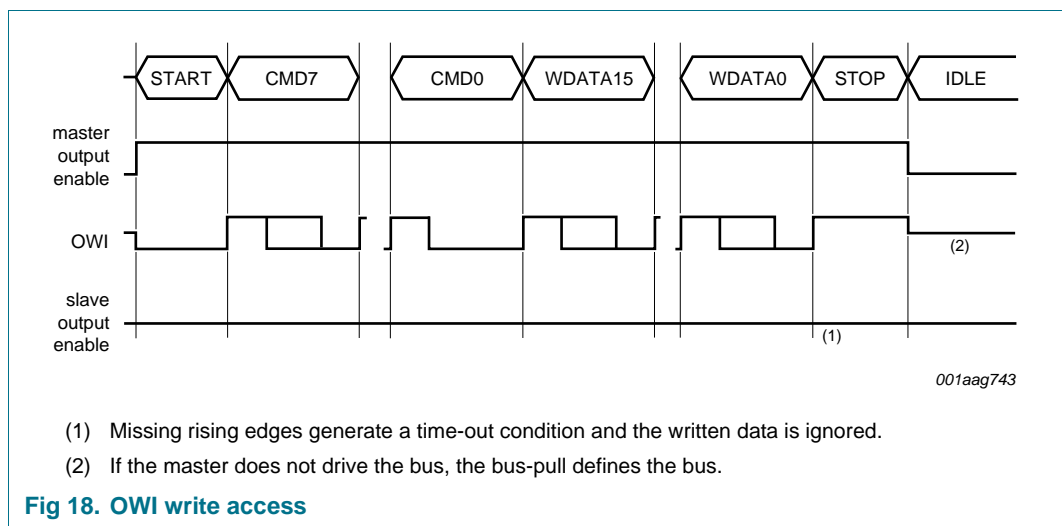

A more detailed description of all customer accessible registers is given in [Section 13.5](#). Both default value and the complete command including the address and write or read request are also listed.

**13.3.1 Write access**

To write data to the non-volatile memory, perform the following procedure:

1. Start condition: The master drives a rising edge after a LOW level
2. Command: The master sends a write command, that is the last bit is not set (CMD0 = 0)
3. Data: The master sends two data bytes
4. Stop condition: The master drives a rising edge after a LOW level

[Figure 18](#) shows the write access of the digital interface. The signal OWI represents the data on the bus from the master or slave. The signals: master output enable and slave output enable indicate when the master or the slave output is enabled or disabled, respectively.

**Note:** As already mentioned in [Section 13.1](#), use the write procedure to enter the command mode. If command mode is not entered, communication is not possible and the sensor operates in normal operation mode. After changing an address, the time  $t_{prog}$  must elapse before changing another address. After changing the content of the non-volatile memory, recalculate and write the checksum (see [Section 13.4](#)).

13.3.2 Read access

To read data from the sensor, perform the following procedure:

1. Start condition: The master drives a rising edge after a LOW level
2. Command: The master sends a read command (CMD0 = 1)
3. Handover: The master sends a handover bit, that is a logic 0 and disables the output after a three-quarter bit period
4. Takeover: The slave drives a LOW level after the falling edge for  $t_{tko(slv)}$
5. Data: The slave sends two data bytes
6. Handover: The slave sends a handover bit, that is a logic 0 and disables the output after a three-quarter bit period
7. Takeover: The master drives a LOW level after the falling edge for  $t_{tko(mas)}$
8. Stop condition: The master drives a rising edge after a LOW level

Figure 19 shows the read access of the digital interface. The signal OWI represents the data on the bus from the master or slave. The signals: master output enable and slave output enable indicate when the master or the slave output is enabled or disabled, respectively.

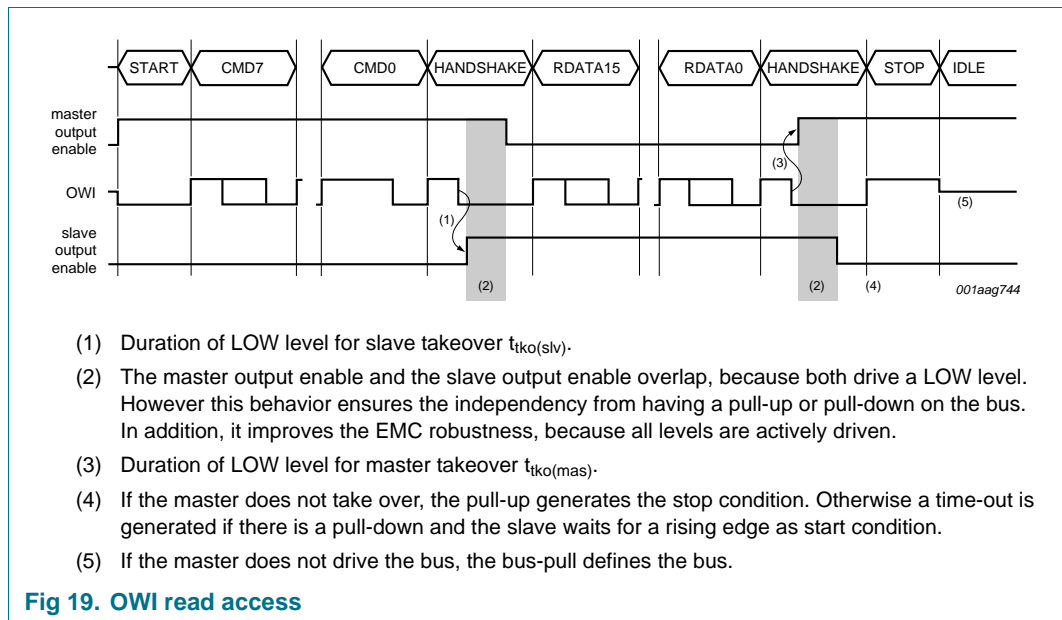

Fig 19. OWI read access

13.3.3 Entering the command mode

After a power-on reset, the sensor provides a time slot  $t_{cmd(ent)}$  for entering the command mode. Keep OUT/DATA pin HIGH for at least  $t_{to}$  and send a specific command sequence (see Figure 20). If command mode is not entered, the sensor starts in the normal operation mode.

During the command mode sequence, the digital SENT output is enabled. The external programming hardware has to overdrive the output with current  $I_{od}$ . If command mode is activated, the digital SENT output is disabled and pin OUT/DATA operates as a digital bidirectional programming interface.

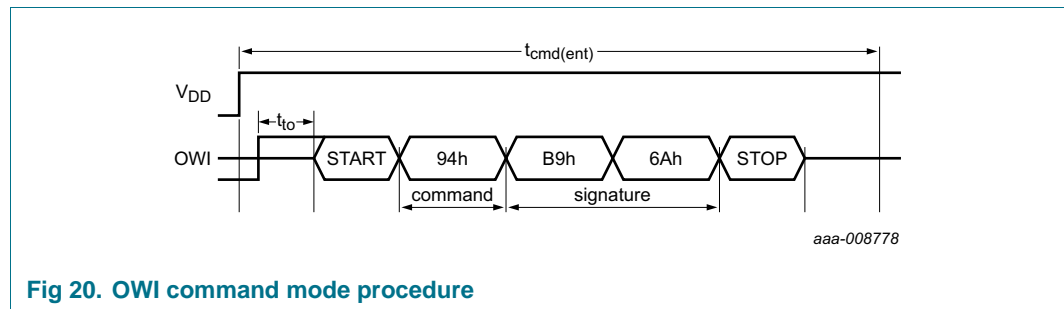

Fig 20. OWI command mode procedure

13.4 Cyclic redundancy check

As already mentioned in Section 7, there is an 8-bit checksum for the non-volatile memory data. To calculate this value, the MSB of the memory data word generates the CRC at first over all corresponding addresses in increasing order.

Read out all addresses from 0h to Eh for calculating the checksum. The Least Significant Byte (LSB) of address Eh contains the previous checksum. Overwrite the value with 0h before starting the checksum calculation.

The generator polynomial for the calculation of the checksum is:

$$G(x) = x^8 + x^2 + x + 1 \tag{9}$$

With a start value of FFh and the data bits are XOR at the  $x^8$  point.

### 13.4.1 Software example in C

```

1  #include <stdio.h>
2
3  int generate_crc(unsigned int data[], int arr_length)
4  {
5      // generator polynomial
6      const int gpoly = 0x107;           // initial value of checksum
7      int crc = 0xFF;
8      // print data values and calculate CRC
9      printf("\nAddress\tValue\n");
10     for (int index = 0; index <= arr_length-1; index++) {
11         printf("0x%1X\t0x%04X\n", index, data[index]);
12         for (int bitnr = 15; bitnr >= 0; bitnr--) {
13             crc <<= 1;
14             crc |= (int) ((data[index] & (1u<<bitnr))>>bitnr);
15             if (crc & 0x100) crc ^= gpoly;
16         }
17     }
18     // print calculated checksum
19     printf("\nCalculated Checksum: 0x%02X\n", crc);
20     return crc;
21 }
22 int main_crc(void)
23 {
24     // data array for checksum calculation
25     // 8 LSB are CRC, fill with 0
26     unsigned int data[] = {0x0818, 0x0000, 0x0800,
27                           0x0FFF, 0x0000, 0x0FFF,
28                           0x0000, 0x0000, 0x0000,
29                           0x0000, 0x0000, 0x0000,
30                           0x0000, 0x0FFF, 0x0000};
31     // determine size of data array
32     int arr_length = sizeof(data) / sizeof(unsigned int);
33     // calculate checksum
34     generate_crc(data, arr_length);
35     return 1;
36 }

```

This example refers to the default register values. The checksum of this data sequence is DBh.

## 13.5 Registers

### 13.5.1 Command registers

To enter the command mode, write the signature given in [Table 32](#) into the specific register using the OWI. Do this procedure as described in [Section 13.3.3](#), with a write command, the signature follows it, but after a power-on reset and not later than  $t_{cmd(ent)}$ .

**Table 32. Command registers**

Command write/read	Register	Bit	Access	Field	Description
82h/83h	CTRL1	15	R	IN_DIAG_MODE	shows if there is a diagnostic condition present; the setting of register field FORCE_DIAG_OFF does not affect this bit
		14	W	FORCE_DIAG_OFF	force diagnostic mode off; default: 0b
		13	-	-	reserved
		12	R	LOW_VOLTAGE_DET	low voltage condition detected
		11 to 9	-	-	reserved
		8	R	ERR_CORRECT	single-bit error of non-volatile memory has been detected and corrected; updated every memory readout; bit remains set until the diagnostic condition disappears and a power-on reset is done
		7	R	UNCORR_ERR	double-bit error of non-volatile memory has been detected; updated every memory readout; bit remains set until the diagnostic condition disappears and a power-on reset is done
		6	R	MAGNET_LOSS_DET	magnet-loss detected; bit remains set until the diagnostic condition disappears and a power-on reset is done; enable magnet-loss detection for raising diagnostic condition
		5	R	BROKEN_BOND_DET	broken bond wire detected; bit remains set until the diagnostic condition disappears and a power-on reset is done
		4	R	CRC_BAD	checksum error detected; updated every start-up
		3	R	OOR_HI	angular value above OOR_THRESHOLD_HI threshold value
		2	R	OOR_LO	angular value below OOR_THRESHOLD_LO threshold value
		1 and 0	-	-	reserved
94h/-	SIGNATURE	15 to 0	W	SIGNATURE	to enter command mode, write signature B96Ah within $t_{cmd(ent)}$ ; for more details, see <a href="#">Section 13.3.3</a>

### 13.5.2 Non-volatile memory registers

The device includes several internal registers which are used for customization and identification.

The initial signature allows read access to all areas but only write access to customer registers. Write accesses to reserved areas are ignored. Since these registers are implemented as non-volatile memory cells, writing to the registers needs a specific time  $t_{\text{prog}}$  after each write access to complete.

As there is no check for the programming time, make sure that no other accesses to the non-volatile memory are made during the programming cycle. Do not address the non-volatile memory during the time  $t_{\text{prog}}$ .

**Note:** To calculate the checksum, read out and consult register addresses 0h to Eh.

Table 33. Non-volatile memory registers

Address	Command write/read	Register	Bit	Description	MSB/LSB Default <sup>[1]</sup>
0h	00h/01h	SENT_CONF	15 to 9	SENT_MODE; SENT modes; see <a href="#">Table 8</a> , <a href="#">Table 12</a> and <a href="#">Table 15</a>	08h/18h (04h)
			8	SLOPE_RATIO; ratio between falling and rising slope of SENT output <b>0b</b> — 7/5 <b>1b</b> — 1/1	(0b)
			7 and 6	SLOPE_TIME; slope time of SENT output <b>00b</b> — 6.5 μs <b>01b</b> — 9.75 μs <b>10b</b> — 9.75 μs <b>11b</b> — 13.0 μs	(00b)

[1] Values represent the default 16-bit value of the memory address while the values in parenthesis represent the default register value.

[2] Settings for single secure sensor mode A.3: ANG\_RNG\_MULT: 40h/00h, CLAMP\_SW\_ANGLE: 0Fh/FFh, CLAMP\_LO: 00h/01h, CLAMP\_HI: 0Fh/FFh

Settings for dual throttle position sensor format A.1 180° full angular range: ANG\_RNG\_MULT: 3Fh/FFh, CLAMP\_SW\_ANGLE: 0Fh/FFh, CLAMP\_LO: 00h/01h, CLAMP\_HI: 0Fh/FEh. In the dual throttle position sensor format A.1 some of the output codes are reserved for diagnostic purposes that limits the output range to 4094 codes. The range must be limited by setting CLAMP\_LO to 1, CLAMP\_HI to 4094 and ANG\_RNG\_MULT = (CLAMP\_HI - CLAMP\_LO)/4095 set to 3Fh/FFh.

Settings for high-speed 12-bit fast mode H.3 180° full angular range: ANG\_RNG\_MULT: 3FE0h, CLAMP\_SW\_ANGLE: 0Fh/FFh, CLAMP\_LO: 00h/01h, CLAMP\_HI: 0Fh/F8h. In the high-speed 12-bit SENT mode H.3 some of the output codes are reserved for diagnostic purposes that limits the output range to 4088 codes. The range must be limited by setting CLAMP\_LO to 1, CLAMP\_HI to 4088 and ANG\_RNG\_MULT = (CLAMP\_HI - CLAMP\_LO)/4095 set to 3Fh/E0h.

[3] Undefined; write as zero for default.

[4] Variable and individual for each device.

**Table 34. ZERO\_ANGLE - mechanical zero degree position (address 8h) bit allocation**

Data format: unsigned fixed point; resolution: 2<sup>-16</sup>.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Value	2 <sup>-1</sup>	2 <sup>-2</sup>	2 <sup>-3</sup>	2 <sup>-4</sup>	2 <sup>-5</sup>	2 <sup>-6</sup>	2 <sup>-7</sup>	2 <sup>-8</sup>	2 <sup>-9</sup>	2 <sup>-10</sup>	2 <sup>-11</sup>	2 <sup>-12</sup>	2 <sup>-13</sup>	2 <sup>-14</sup>	2 <sup>-15</sup>	2 <sup>-16</sup>

Mechanical angular range 0000h = 0° to FFFFh = 180° – 1 LSB.

Examples:

- Mechanical zero angle 0° = 0000h
- Mechanical zero angle 10° = 0E38h
- Mechanical zero angle 45° = 4000h

**Table 35. CLAMP\_LO - lower clamping level output data (address 4h) bit allocation**

Data format: unsigned integer; resolution: 2<sup>0</sup>.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Value	U <sup>[1]</sup>	U <sup>[1]</sup>	U <sup>[1]</sup>	U <sup>[1]</sup>	2 <sup>11</sup>	2 <sup>10</sup>	2 <sup>9</sup>	2 <sup>8</sup>	2 <sup>7</sup>	2 <sup>6</sup>	2 <sup>5</sup>	2 <sup>4</sup>	2 <sup>3</sup>	2 <sup>2</sup>	2 <sup>1</sup>	2 <sup>0</sup>

[1] Undefined; write as zero for default; returns any value when read.

Examples:

- 80° = 1820
- 40° = 910
- 0° = 0

**Table 36. CLAMP\_HI - upper clamping level output data (address 5h) bit allocation**

Value	2 <sup>-12</sup>	2 <sup>-13</sup>	2 <sup>-14</sup>	[1]	CLAMP_SW_ANGLE											

[1] BROKEN\_BONDWIRE

$$ANG\_RNG\_MULT = \frac{CLAMP\_HI - CLAMP\_LO}{4095} \times \frac{180^\circ}{ANGULAR\_RANGE} \tag{10}$$

Example:

- Reserved data range for dual throttle position sensor format A.1 180° full angular range:  $ANG\_RNG\_MULT = \frac{4094 - 1}{4095} \times \frac{180^\circ}{180^\circ} = 0.9995115995 \rightarrow 3FFFh$

- Reserved data range for SENT 12-bit fast mode 180° full angular range:

$$ANG\_RNG\_MULT = \frac{4088 - 1}{4095} \times \frac{180^\circ}{180^\circ} = 0.998046398 \rightarrow 3FE0h$$

**Table 39. CLAMP\_SW\_ANGLE - clamp switch angle (address 3h) bit allocation**

Data format: unsigned integer; resolution: 2<sup>0</sup>.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Value	ANG_RNG_MULT_LSB		[1]	2 <sup>11</sup>	2 <sup>10</sup>	2 <sup>9</sup>	2 <sup>8</sup>	2 <sup>7</sup>	2 <sup>6</sup>	2 <sup>5</sup>	2 <sup>4</sup>	2 <sup>3</sup>	2 <sup>2</sup>	2 <sup>1</sup>	2 <sup>0</sup>	

[1] BROKEN\_BONDWIRE

Mechanical angular range 000h = 0° to FFFh = 180° – 1 LSB.

$$CLAMP\_SW\_ANGLE = \frac{I}{2} \times \left( 1 + \frac{CLAMP\_HI - CLAMP\_LO}{4095} \times \frac{I}{ANG\_RNG\_MULT} \right) \quad (11)$$

If the magnetic field angle is larger than the CLAMP\_SW\_ANGLE, the output switches to CLAMP\_LO for a positive slope. Program the value of CLAMP\_SW\_ANGLE, which can be calculated from other non-volatile memory constants.

## 14. Electromagnetic compatibility

EMC is verified in an independent and certified test laboratory.

### 14.1 Emission (CISPR 25)

Tests according to CISPR 25 were fulfilled.

#### 14.1.1 Conducted radio disturbance

Test of the device according to CISPR 25, third edition (2008-03), Chapter 6.2.

Classification level: 5.

#### 14.1.2 Radiated radio disturbance

Test of the device according to CISPR 25, third edition (2008-03), Chapter 6.4.

Classification level: 5 (without addition of 6 dB in FM band).

### 14.2 Radiated disturbances (ISO 11452-1 third edition (2005-02), ISO 11452-2, ISO 11452-4 and ISO 11452-5)

The common understanding of the requested function is that an effect is tolerated as described in [Table 40](#) during the disturbance. The reachable values are setup-dependent and differ from the final application.

**Table 40. Failure condition for radiated disturbances**

Parameter	Comment	Max	Unit
Variation of angular value	value measured relative to the output at test start	±1.8	deg
SENT sequence	allowed sequentially failing frames	2	frame
SENT transmission	allowed failing frames within 100 following frames	3	frame

#### 14.2.1 Absorber lined shielded enclosure

Tests according to ISO 11452-2, second edition (2004-11), were fulfilled.

Test level: 200 V/m; extended up to 4 GHz.

State: A.

#### 14.2.2 Bulk-current injection

Tests according to ISO 11452-4, third edition (2005-04), were fulfilled.

Test level: 200 mA.

State: A.

### 14.2.3 Strip line

Tests according to ISO 11452-5, second edition (2002-04), were fulfilled.

Test level: 200 V/m; extended up to 1 GHz.

State: A.

### 14.2.4 Immunity against mobile phones

Tests according to ISO 11452-2, second edition (2004-11), were fulfilled.

State: A.

Definition of Global System for Mobile Communications (GSM) signal:

- Pulse modulation: per GSM specification (217 Hz; 12.5 % duty cycle)
- Modulation grade:  $\geq 60$  dB
- Sweep: linear 800 MHz to 3 GHz (duration 10 s at 890 MHz, 940 MHz and 1.8 GHz band)
- Antenna polarization: vertical, horizontal
- Field strength: 200 V/m during on-time [calibration in Continuous Wave (CW)]

In deviation of ISO 11452-2, a GSM signal instead of an AM signal was used.

## 14.3 Electrical transient transmission by capacitive coupling [ISO 7637-3, second edition (2007-07)]

The common understanding of the requested function is that an effect is tolerated as described in [Table 40](#) during the disturbance.

Tests according to ISO 7637-3 were fulfilled.

Test level: IV (for 12 V electrical system).

Classification level: A for positive and negative pulses assuming a start of a new SENT frame within 400  $\mu$ s is allowed otherwise B.

## 14.4 Electrical transient transmission by inductive coupling [ISO 7637-3, second edition (2007-07)]

The common understanding of the requested function is that an effect is tolerated as described in [Table 40](#) during the disturbance.

Tests according to ISO 7637-3 were fulfilled.

Test level: IV (for 12 V electrical system).

Classification level: A for positive and negative pulses assuming a start of a new SENT frame within 400  $\mu$ s is allowed otherwise B.

## 15. ElectroStatic Discharge (ESD)

### 15.1 Human body model (AEC-Q100-002)

The KMA215 is protected up to 8 kV, according to the human body model at 100 pF and 1.5 k $\Omega$ . This protection is ensured at all external pins (OUT/DATA, V<sub>DD</sub> and GND).

Classification level: H3B.

Furthermore, all interconnects (pins between package head and package body) must not be damaged at 2 kV.

Classification level: H2.

### 15.2 Human metal model (ANSI/ESD SP5.6-2009)

The KMA215 is protected up to 8 kV, according to the human metal model at 150 pF and 330  $\Omega$  inside the ESD gun. This test utilizes waveforms of the IEC 61000-4-2 standard on component level. Apply the contact discharge in an unsupplied state at pins OUT/DATA and V<sub>DD</sub> referred to GND which is connected directly to the ground plane.

Test setup: A.

Test level: 5.

### 15.3 Machine model (AEC-Q100-003)

The KMA215 is protected up to 400 V, according to the machine model. This protection is ensured at all external pins (OUT/DATA, V<sub>DD</sub> and GND).

Classification level: M4.

Furthermore, all interconnects (pins between package head and package body) must not be damaged at 200 V.

Classification level: M3.

All pins have latch-up protection.

### 15.4 Charged-device model (AEC-Q100-011)

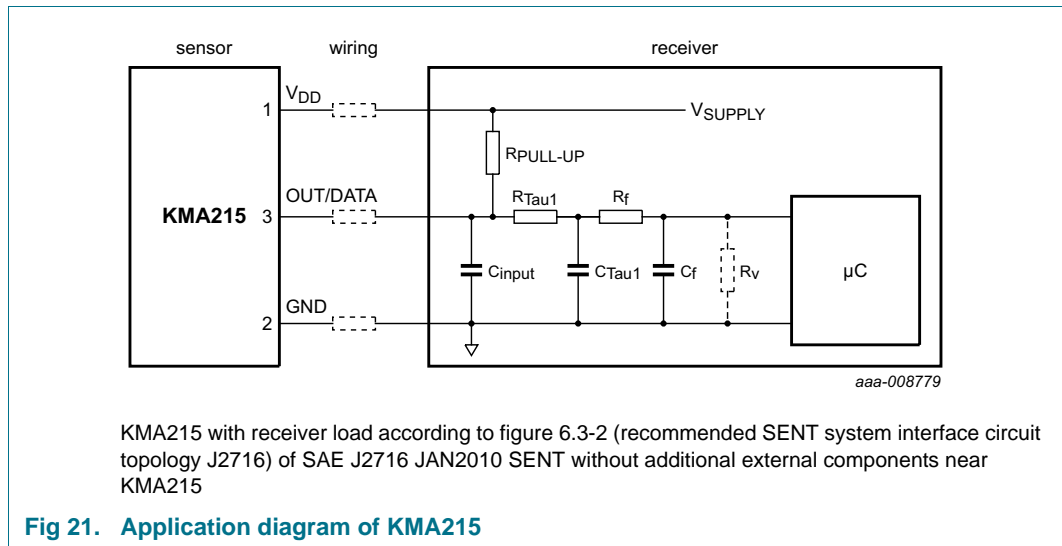

The KMA215 is protected up to 750 V, according to the charged-device model. This protection is ensured at all external pins (OUT/DATA, V<sub>DD</sub> and GND).

Classification level: C4.

Furthermore, all interconnects (pins between package head and package body) is protected up to at 500 V.

Classification level: C3B.

## 16. Application information

## 17. Test information

### 17.1 Quality information

This product has been qualified in accordance with the Automotive Electronics Council (AEC) standard *Q100 Rev-G - Failure mechanism based stress test qualification for integrated circuits*, and is suitable for use in automotive applications.

## 18. Marking

## 19. Terminals

Lead frame material: CuZr with 99.9 % Cu and 0.1 % Zr.

Lead finish: matt tin; thickness 7 µm to 11 µm.

20. Package outline

Plastic single-ended multi-chip package;  
6 interconnections; 3 in-line leads

SOT1288-2

Fig 23. Package outline SOT1288-2

## 21. Handling information

## 22. Solderability information

The solderability qualification is according to AEC-Q100 Rev-G. Recommended soldering process for leaded devices is wave soldering. The maximum soldering temperature is 260 °C for maximum 5 s. Device terminals are compatible with laser and electrical welding. The device is reflow capable.

## 23. Revision history

Table 41. Revision history

KMA215 v.1	20140224	Product data sheet	-	-

## 24. Legal information

### 24.1 Data sheet status

Document status <sup>[1][2]</sup>	Product status <sup>[3]</sup>	Definition
Objective [short] data sheet	Development	This document contains data from the objective specification for product development.
Preliminary [short] data sheet	Qualification	This document contains data from the preliminary specification.
Product [short] data sheet	Production	This document contains the product specification.

[1] Please consult the most recently issued document before initiating or completing a design.

[2] The term 'short data sheet' is explained in section "Definitions".

[3] The product status of device(s) described in this document may have changed since this document was published and may differ in case of multiple devices. The latest product status information is available on the Internet at URL <http://www.nxp.com>.

### 24.2 Definitions

**Draft** — The document is a draft version only. The content is still under internal review and subject to formal approval, which may result in modifications or additions. NXP Semiconductors does not give any representations or warranties as to the accuracy or completeness of information included herein and shall have no liability for the consequences of use of such information.

**Short data sheet** — A short data sheet is an extract from a full data sheet with the same product type number(s) and title. A short data sheet is intended for quick reference only and should not be relied upon to contain detailed and full information. For detailed and full information see the relevant full data sheet, which is available on request via the local NXP Semiconductors sales office. In case of any inconsistency or conflict with the short data sheet, the full data sheet shall prevail.

**Product specification** — The information and data provided in a Product data sheet shall define the specification of the product as agreed between NXP Semiconductors and its customer, unless NXP Semiconductors and customer have explicitly agreed otherwise in writing. In no event however, shall an agreement be valid in which the NXP Semiconductors product is deemed to offer functions and qualities beyond those described in the Product data sheet.

### 24.3 Disclaimers

**Limited warranty and liability** — Information in this document is believed to be accurate and reliable. However, NXP Semiconductors does not give any representations or warranties, expressed or implied, as to the accuracy or completeness of such information and shall have no liability for the consequences of use of such information. NXP Semiconductors takes no responsibility for the content in this document if provided by an information source outside of NXP Semiconductors.

In no event shall NXP Semiconductors be liable for any indirect, incidental, punitive, special or consequential damages (including - without limitation - lost profits, lost savings, business interruption, costs related to the removal or replacement of any products or rework charges) whether or not such damages are based on tort (including negligence), warranty, breach of contract or any other legal theory.

Notwithstanding any damages that customer might incur for any reason whatsoever, NXP Semiconductors' aggregate and cumulative liability towards customer for the products described herein shall be limited in accordance with the *Terms and conditions of commercial sale* of NXP Semiconductors.

**Right to make changes** — NXP Semiconductors reserves the right to make changes to information published in this document, including without limitation specifications and product descriptions, at any time and without notice. This document supersedes and replaces all information supplied prior to the publication hereof.

**Suitability for use in automotive applications** — This NXP Semiconductors product has been qualified for use in automotive applications. Unless otherwise agreed in writing, the product is not designed, authorized or warranted to be suitable for use in life support, life-critical or safety-critical systems or equipment, nor in applications where failure or malfunction of an NXP Semiconductors product can reasonably be expected to result in personal injury, death or severe property or environmental damage. NXP Semiconductors and its suppliers accept no liability for inclusion and/or use of NXP Semiconductors products in such equipment or applications and therefore such inclusion and/or use is at the customer's own risk.

**Applications** — Applications that are described herein for any of these products are for illustrative purposes only. NXP Semiconductors makes no representation or warranty that such applications will be suitable for the specified use without further testing or modification.

Customers are responsible for the design and operation of their applications and products using NXP Semiconductors products, and NXP Semiconductors accepts no liability for any assistance with applications or customer product design. It is customer's sole responsibility to determine whether the NXP Semiconductors product is suitable and fit for the customer's applications and products planned, as well as for the planned application and use of customer's third party customer(s). Customers should provide appropriate design and operating safeguards to minimize the risks associated with their applications and products.

NXP Semiconductors does not accept any liability related to any default, damage, costs or problem which is based on any weakness or default in the customer's applications or products, or the application or use by customer's third party customer(s). Customer is responsible for doing all necessary testing for the customer's applications and products using NXP Semiconductors products in order to avoid a default of the applications and the products or of the application or use by customer's third party customer(s). NXP does not accept any liability in this respect.

**Limiting values** — Stress above one or more limiting values (as defined in the Absolute Maximum Ratings System of IEC 60134) will cause permanent damage to the device. Limiting values are stress ratings only and (proper) operation of the device at these or any other conditions above those given in the Recommended operating conditions section (if present) or the Characteristics sections of this document is not warranted. Constant or repeated exposure to limiting values will permanently and irreversibly affect the quality and reliability of the device.

**Terms and conditions of commercial sale** — NXP Semiconductors products are sold subject to the general terms and conditions of commercial sale, as published at <http://www.nxp.com/profile/terms>, unless otherwise agreed in a valid written individual agreement. In case an individual agreement is concluded only the terms and conditions of the respective agreement shall apply. NXP Semiconductors hereby expressly objects to applying the customer's general terms and conditions with regard to the purchase of NXP Semiconductors products by customer.

**No offer to sell or license** — Nothing in this document may be interpreted or construed as an offer to sell products that is open for acceptance or the grant, conveyance or implication of any license under any copyrights, patents or other industrial or intellectual property rights.

**Export control** — This document as well as the item(s) described herein may be subject to export control regulations. Export might require a prior authorization from competent authorities.

**Translations** — A non-English (translated) version of a document is for reference only. The English version shall prevail in case of any discrepancy between the translated and English versions.
